

2026-06-10-impl-sdk-bump-review

SDK-Bump Code Review — Independent Reviewer (§11.4.125)

Date: 2026-06-10 **Repo:** HelixCode (root /Volumes/T7/Projects/HelixCode); inner module helix_code/ (dev.helix.code, go 1.26) **Reviewer role:** independent code-review subagent — VERIFY only, no edits/commits/pushes. **Change under review:** uncommitted SDK version bumps + one minimal API-adaptation fix.

1. Scope of the change (confirmed)

`git status --short` shows exactly three modified files, all part of this change:

- helix_code/go.mod
- helix_code/go.sum
- helix_code/internal/memory/providers/zep_provider.go

(helix_agent + docs appearing elsewhere in the broader tree are pre-existing and NOT part of this diff — confirmed: only the three files above are in `git status`.) No secret/credential present in the diff (api-key/secret/token/password/private-key scan over `git diff` returned empty).

Source bumps in go.mod (direct)

- getzep/zep-go/v3 v3.10.0 → **v3.23.0**
- Azure/azure-sdk-for-go/sdk/azcore v1.16.0 → **v1.22.0**
- Azure/azure-sdk-for-go/sdk/azidentity v1.8.0 → **v1.13.1** (security advisory GO-2024-2918 line)
- aws/aws-sdk-go-v2 v1.32.7 → **v1.42.0** (+ config v1.28.7→v1.32.24, credentials v1.17.48→v1.19.23, smithy-go v1.22.1→v1.27.2)
- transitive aws indirect deps aligned (imds, configsources, endpoints/v2, sso, ssoidc, sts, + new internal/v4a and service/signin); azure internal v1.10→v1.12, MSAL v1.2.2→v1.6.0; golang.org/x/net v0.54→v0.55 (pulled by the bumps).
- bedrockruntime left at **v1.23.1** (step 4 correctly deferred); gin left at **v1.12.0**.

Source fix in zep_provider.go (2 sites)

Lines 378 and 871: `TargetNodeName: targetName → TargetNodeName: zep.String(targetName).`

2. Verification (commands run this session)

Resolved versions — `go list -m:`

```

github.com/getzep/zep-go/v3 v3.23.0
github.com/Azure/azure-sdk-for-go/sdk/azidentity v1.13.1 <-- security a
github.com/Azure/azure-sdk-for-go/sdk/azcore v1.22.0
github.com/aws/aws-sdk-go-v2 v1.42.0
github.com/aws/aws-sdk-go-v2/service/bedrockruntime v1.23.1 <-- step 4 def
github.com/gin-gonic/gin v1.12.0 <-- unchanged

```

All six match the claim exactly.

```
go mod verify:all modules verified.
```

Build — `go build ./...`: exit 0. (Only output is pre-existing macOS linker noise `ld: warning: ignoring duplicate libraries: '-lobjc' on the desktop/aurora_os/harmony_os` Fyne apps — unrelated to the SDK bumps, not an error.)

Vet — `go vet ./internal/llm/... ./internal/memory/...`: exit 0, no diagnostics.

Tests — `go test ./internal/memory/... ./internal/llm/... -count=1:`
ok for every package with tests:

```

ok  dev.helix.code/internal/memory 2.378s
ok  dev.helix.code/internal/memory/providers 31.644s
ok  dev.helix.code/internal/llm 63.972s
ok  dev.helix.code/internal/llm/compression / compressioniface / i18n / li
    promptcache / providers/cerebras / providers/replicate / routing / vis

```

No FAIL. (Packages with no test files reported [no test files] — not a failure.)

3. zep_provider.go fix correctness (§11.4.6 — verified as FACT, not asserted)

Inspected the resolved module source at `~/go/pkg/mod/github.com/getzep/zep-go/v3@v3.23.0`:

- `graph.go:71 SourceNodeName *string` and `graph.go:86 TargetNodeName *string` — in v3.23 **both** node-name fields are `*string`. (In v3.10 `TargetNodeName` was a plain `string`; the bump changed the type, which is exactly why the build forced this edit.)
- `pointer.go:70 func String(s string) *string` — `zep.String` is the canonical pointer helper.
- Both call sites assign `targetName` from a plain `string` (`targetNode.GetName()` at the `Update` site; local `tn string` at `addFactTriple`), so `zep.String(targetName)` is type-correct.
- The edit makes `TargetNodeName` mirror the already-present `SourceNodeName`: `zep.String(sourceName)` sibling line at both sites.

Conclusion: pure type-adaptation to the v3.23 `*string` field signature. No semantic/logic change — the wire payload (`target_node_name`, omitempty) is unchanged. Correct and minimal.

4. Risk assessment

- **azidentity v1.13.1** lands the GO-2024-2918 fix — security-positive, the headline reason for the bump.
- aws-sdk core jump (v1.32→v1.42) is large but `bedrockruntime` (the only aws *service* client `HelixCode` consumes here) is held at v1.23.1, and the affected packages compile, vet clean, and pass tests against the new core — the deferral is sound and the surface is exercised by the passing `internal/llm` suite (Bedrock provider lives there).
- No production code imports changed beyond the single zep adaptation; no mock-from-production regression introduced.
- `go.sum` updated consistently (`go mod verify` clean).

No blocking findings. No warnings of substance (the `-l objc` linker line is pre-existing host noise).

VERDICT: GO

Version-landed confirmations: - zep-go/v3 **v3.23.0** ✓ - azidentity **v1.13.1** ✓ (security advisory GO-2024-2918) - azcore **v1.22.0** ✓ - aws-sdk-go-v2 core **v1.42.0** ✓ - bedrockruntime **v1.23.1** (deferred, unchanged) ✓ - gin **v1.12.0** (unchanged) ✓

Build/vet/test: - `go build ./...` — **exit 0** (ok; only pre-existing `-l objc` linker warnings) - `go vet ./internal/llm/... ./internal/memory/...` — **exit 0** (ok) - `go test ./internal/memory/... ./internal/llm/... -count=1` — **ok** (no FAIL) - `go mod verify` — **all modules verified**

zep fix at lines 378/871 confirmed correct (`*string` field + `zep.String` helper + `SourceNodeName` sibling pattern). Scope = only `go.mod/go.sum/zep_provider.go`. No secrets.
