

CONSOLIDATED_REPORT_ADDENDUM.wave2.

Consolidated Report — Addendum: previously-un-assessed modules (2026-06-04, Wave 2)

This addendum synthesizes the 12 Wave-2 module assessments that were rate-limited in the prior discovery round. All findings are sourced from the assessments above. “unverified” is preserved verbatim wherever the assessor flagged it. No runtime claims are asserted beyond what an assessor explicitly captured.

A. Newly-assessed module status

Module	Builds	Broken/disabled?	Dead code
challenges	Partial — go build ./... FAILS	pkg/userflow/ (118 .go) unbuildable: missing digital.vasic.containers dep, 0 replace directives	Whole pkg/userflow/ effectively dead in this che
security	Yes	None	None
llms_verifier	App module: yes / outer+meta: no	Outer module won’t build offline (missing go.sum entries)	*.go.backup, backup scoring_example.go orphan main, committed *.db.backup_*, server.pid
helix_agent	Yes	None (0 bare skips of 1172)	No .disabled/.bak in internal/cmd/pkg
doc_processor	No — committed merge-conflict markers	pkg/i18n/translator.go + translator_test.go have unresolved <<<<<</>>>>>> markers (committed at HEAD 7750140)	None observed in buildable

Module	Builds	Broken/disabled?	Dead code
llm_orchestrator	Yes	None	None
llm_provider	Yes	None	pkg/discovery/ discovery.go:162-1 deprecated Tier-3 hardcoded fallback still consulted at runtime
vision_engine	Yes (default) / partial (vision tag)	- tags vision build fails ONLY for missing host OpenCV (expected, isolated behind //go:build vision)	None — build-tag split intentional
assets	n/a (brand dir)	None	None
github_pages_website	Partial (static site = serve; not run at runtime)	HTML validation soft-skips when html5validator absent (effectively unvalidated)	courses/player.js: quality-switch stub; certificate.html:2 PDF stub
root meta-repo (dev.helix.code go 1.25.2)	Yes	None (errors only from non-module cli_agents*/ reference trees)	.gitmodules.bak.ht to-ssh; tracked coverage.out/ README.html/README
helix_code (inner, go 1.26)	Yes (Asmt 5/11) / unverified (Asmt 12 timed out)	None disabled; cold compile hit 90-180s timeout in Asmt 12	internal/tools/ lsp_fakeserver (test fixture)
helix_qa	Yes	None	None

B. New broken/failing/disabled items (fix-first candidates) — with evidence

1. **doc_processor — committed broken build (CONFIRMED).** pkg/i18n/
translator.go and pkg/i18n/translator_test.go contain unresolved git
merge-conflict markers at HEAD 7750140 (clean working tree → in version control, not
local). go build ./... → pkg/i18n/translator.go:4:1: expected
'package', found '<<'. The binary cmd/docprocessor imports i18n so it
cannot build; root automation_test.go/e2e_test.go/security_test.go

cascade-fail. README claims §11.4 anti-bluff “every claim exercised” while the repo does not build — a direct contradiction. **Highest-severity fix-first.**

2. **challenges** — `go build ./... broken out-of-the-box (CONFIRMED)`. `pkg/userflow/container_infra.go:8-13` imports `digital.vasic.containers/pkg/{compose,event,health,logging,runtime,serviceregistry}` with 0 replace directives and 0 containers entries in `go.sum`. Breaks `pkg/userflow/` (118 files) and the only binary `cmd/userflow-runner`. `helix-deps.yaml` does not declare the containers dep (CONST-054 manifest drift). The other 14 `pkg/` packages build + test clean.
3. **llms_verifier** — **outer/meta module not buildable offline (CONFIRMED)**. From repo root `go build ./... → missing go.sum entry for go-sqlite3, bcrypt, brotli, gin, quic-go, uuid, logrus, kafka-go, amqp091`; Asmt 11 notes `go.sum` is **ABSENT** at that layer. The real product is the inner `llm-verifier/` module which builds + vets clean. Outer module needs `go mod download/go get` from a clean checkout.
4. **github_pages_website** — **HTML test silently validates nothing (CONFIRMED)**. `test-website.sh:45-53` prints `WARNING: html5validator not installed, skipping HTML validation and exits without failure` — a “passing” HTML test that asserts nothing (anti-bluff concern). `package.json:16-18` build/logs/status scripts invoke `docker-compose` but no `docker-compose.yml` exists (only `Containerfile`; `start-website.sh` uses `podman`) — script/manifest mismatch.
5. **helix_code** — `internal/memory/providers/faiss_provider.go` **self-described simulation (CONFIRMED static read, gating unverified)**. Struct comments say “not used in simulation”, “GPU not available in simulation”, “always true in simulation”; `grep for os/exec|http.Post|http.Get|net.Dial → 0` matches (no real FAISS/IPC). Candidate CONST-050(A)/Rule-2 production-mock violation — **unverified** whether gated to unit-tests-only.
6. **helix_code** — `internal/worker/consensus.go:222` **multi-peer election transport not implemented**. Self-flagged §11.4/CONST-035 gap: vote-request transport “is not implemented (peers=%d). Node remains Candidate” — election can hang (also a concurrency risk, §E).

C. New dead-code suspects

- **challenges**: `pkg/userflow/` (118 .go files) — effectively dead/unbuildable pending the containers dependency.
- **llms_verifier**: `llm-verifier/api/handlers.go.backup`, `llm-verifier/cmd/main.go.backup` (wrong suffix, not compiled); `backup/scoring_example.go` (package `main` outside any module — orphaned); committed `*.db.backup_*` artifacts under `cmd/`.
- **llms_verifier**: `llm-verifier/go.mod:172` replace `digital.vasic.llmprovider => ../../LLMProvider` — target submodule MISSING and no Go file imports `digital.vasic.llmprovider` → dead replace directive.
- **llm_orchestrator**: `go.mod:18` replace `digital.vasic.llmprovider => ../../LLMProvider` — actual sibling is `../llm_provider` (case mismatch, CONST-052); unused by source so build unaffected — latent dependency-wiring bug. Plus stray submodule-analysis.txt (317 B).

- **root meta-repo:** `.gitmodules.bak.https-to-ssh`.
- **doc_processor / llm_orchestrator:** stale `submodule-analysis.txt` referencing older commit (8b83447 vs HEAD 7750140 in `doc_processor`).
- Note (not dead code): `helix_agent/cmd/cognee-mock/` and `helix_code/internal/tools/lsp_fakeserver/` are named mocks/fixtures — flagged to confirm they are NOT in a production path (assessors treat them as test surface; production-path status **unverified**).

D. New tooling gaps (Snyk / SonarQube / govulncheck / race / profiling) per module

Module	Snyk	Sonar	govulncheck	gosec
challenges	absent	absent	absent	absent
security	absent	absent	absent (course-exercise only)	absent
llms_verifier	absent	absent	wired (Makefile:90,97)	wired (Makefile:90,97)
helix_agent	present (.snyk v1.25.0)	present (sonar-project.properties)	wired (security-scan)	.gosec .
doc_processor	absent	absent	absent	absent
llm_orchestrator	absent	absent	absent	absent
llm_provider	absent	absent	absent	absent
vision_engine	absent	absent	absent	absent
github_pages_website	absent	absent	absent	n/a

Module	Snyk	Sonar	govulncheck	gosec
helix_code	present (. snyk+sonar)	present	wired (run-all-tests.sh)	—

Host tooling (Asmt 11): snyk, sonar-scanner, govulncheck, pprof binary all **NOT on PATH**; podman ON PATH, docker NOT FOUND (Rule-4/§11.4.76 consistent). SONARQUBE_SNYK_IMPLEMENTATION.md is an aspirational PLAN (status “STARTING”, Phase 2-4 unchecked) — scanning is **configured-but-not-runnable** here. Root coverage.out (5 KB) tracked — likely stale build derivative (§11.4.30 candidate).

E. New concurrency risks (file:func)

- **helix_code** — internal/worker/consensus.go (**Raft-style election**): when vote-request transport is absent (: 222), node “remains Candidate” — election can hang. Highest-attention new risk. (Manager-pattern mutexes documented but **not runtime -race-verified**.)
- **helix_agent** — internal/background/worker_pool.go (worker pool + progress channels) and internal/streaming: Makefile has dedicated test-race/audit-concurrency targets implying known sensitivity; -race **not run** this session — none independently confirmed.
- **challenges** — pkg/runner/parallel.go (parallel challenge execution) and pkg/monitor/websocket.go (concurrent WS clients): highest-attention spots; 14 building pkgs passed -short (run **without** -race to stay under timeout → race-cleanliness **unverified** this session; Makefile intends -race).
- **No NEW defects observed** in security, llm_provider, llm_orchestrator, vision_engine — all use explicit sync.Mutex/RWMutex/atomic; llm_orchestrator (pkg/agent), vision_engine (pkg/remote), llm_provider (core pkgs) passed -race clean where run. Provider/discovery/network-gated paths **unverified** under -race.

F. New docs/courses/website/diagram/SQL gaps

- **Missing root docs/ARCHITECTURE.md** — CLAUDE.md §11 cites it as the architecture reference but find -iname ARCHITECTURE*.md is empty; content lives in implementation_guide/002_Architecture_Diagrams.md. STALE doc pointer.
- **No source diagram files** (.mmd/.puml/.drawio) anywhere — only rendered .png exports under docs/bluff_proofing/ and docs/improvements/ → no regen source per §11.4.77.
- VIDEO_COURSE_CURRICULUM.md is STUB/plan only (Status: Planned, 71 lines, no root material). Real course assets exist only inside the github_pages_website/ submodule (docs/courses, ~46 entries in course-data.js).
- website/ is PLAN-ONLY (WEBSITE_CONTENT_PLAN.md, Status: Draft, “Hugo or Docusaurus (TBD)”). Real site is the github_pages_website/ submodule.
- **SQL secret-in-source:** postgres-init.sql hardcodes DB password helixpass (CONST-042 concern). init.sql only creates extensions/grants — no application table DDL at root (tables presumably via Go migrations, **unverified**).
- **§11.4.83 evidence tree sparse:** docs/qa/ has only 6 feature run dirs (HXC-014/016/029/030/035/036) vs 767 test files — far from fully populated; README confirms the gate is “release-gate ONLY”, not wired pre-commit/pre-push.

- **llms_verifier doc sprawl / self-cert smell:** 159 root .md files (AGENTS.md 152 KB, CLAUDE.md 137 KB) incl. FINAL_*/ULTIMATE_*/COMPLETE_*/*_SUCCESS.md/COMPLETION_CELEBRATION.md — exactly the “complete/passing” wording Rule 9 / §11.4 forbids without pasted runtime evidence; vastly over-states verified state.
- **root meta-repo doc sprawl:** ~80-150 PHASE_*/COMPREHENSIVE_*/*_REPORT.md/FINAL_COMPLETION files, largely stale/aspirational and unreconciled.
- **github_pages_website staleness:** WEBSITE_VERSION.md v1.1.0 / 2025-11-25 — ~6 months stale vs 2026-06-04 (§11.4.99 territory). Tracked runtime logs docs/nginx-logs/access.log+error.log (CONST-053 candidate). Provider claims (15+ providers) ARE substantiated by real helix_code/internal/llm/*_provider.go impls — not bluffed.
- **assets:** §3.2 of root CLAUDE.md lists assets/ as a SUBMODULE but it is NOT in .gitmodules (plain tracked subdir); assets/CLAUDE.md:12 is a garbled §11.9-anchor fragment; .gitignore references a non-existent derivative generator.
- **helix_code manual drift:** CLAUDE.md §3.2.1 claims ~45 internal packages; actual ~60 (approval, clarification, planner, secrets, telemetry, etc. not listed).

G. Modules that returned no data (rate-limited again) — do NOT assume clean

- **None of the 12 Wave-2 modules returned empty** — all produced assessments. However, the following surfaces remain **explicitly unverified** (not “clean”):
 - **helix_code full build/test (Asmt 12):** cold compile hit the 90-180s timeout; go build ./cmd/cli/, go vet ./cmd/cli/, even go build ./internal/version ./internal/logo did NOT complete. Compile success **unverified within time cap** (Asmt 5/11 reported it builds clean — treat as conflicting evidence, re-verify with warm cache).
 - **helix_qa:** built clean (Asmt 11) but **not deep-assessed** this wave (no skip/placeholder/concurrency/docs pass).
 - **containers submodule:** never directly assessed — referenced only as the missing dependency breaking challenges. Its own build/test state is **unverified**.
 - All infra-bound suites (Postgres/Redis/Ollama/Kafka/RabbitMQ, live provider keys) across every module were **NOT run** per read-only/no-infra constraints — runtime behavior **unverified**.
 - Static-scan execution (Snyk/Sonar/govulncheck/gosec) **NOT run** anywhere (tools absent from PATH).

H. Updated prioritized actions to fold into the next implementation wave (top 8)

1. **Resolve doc_processor committed merge conflict** — fix pkg/i18n/translator.go (lines 4,14,32,37,58,75,80,89,98) + translator_test.go (4,38,169). Restores go build ./... and the binary. A committed non-compiling repo that claims §11.4 anti-bluff green is the most urgent contradiction. (§11.4.108 SOURCE-layer failure; §11.4.121 commit-hygiene relevance.)
2. **Wire challenges → containers dependency** — add digital.vasic.containers replace/require + go.sum entries (flat-root per CONST-051(C)) and declare it in helix-deps.yaml (CONST-054). Unblocks pkg/userflow/ + cmd/userflow-runner.
3. **Restore llms_verifier outer-module buildability** — regenerate/commit the absent root go.sum (or document the go mod download bootstrap as a §11.4.77 regeneration

- mechanism). Remove dead replace `digital.vasic.llmprovider`
=> `../LLMProvider` (target MISSING).
4. **Investigate + classify** `helix_code/internal/memory/providers/faiss_provider.go` — confirm whether the self-described “simulation” is gated to unit-tests-only; if reachable from production, it is a CONST-050(A)/Rule-2 violation requiring a real FAISS/IPC impl or fail-loud sentinel.
 5. **Fix the github_pages_website HTML soft-skip + docker-compose phantom** — make `test-website.sh` FAIL (not skip) when `html5validator` is absent (anti-bluff §11.4.98), and reconcile `package.json` docker-compose scripts with the actual podman/Containerfile workflow. Untrack `nginx-logs/*.log` (CONST-053).
 6. **Refresh helix_agent stale .snyc ignore** — the SNYK-GOLANG-...logr ignore expired 2026-06-01 (now active as of 2026-06-04); re-triage or re-justify. Reconcile inner CLAUDE.md make `container-*` claims vs root §11.4.99 note.
 7. **Address structural doc/hygiene debt** — create/retarget root `docs/ARCHITECTURE.md` (or fix the §11 pointer); add `.mmd/.puml` source diagrams (§11.4.77); rotate the hardcoded `helixpass` in `postgres-init.sql` (CONST-042); prune the `llms_verifier` + root “FINAL/COMPLETE/SUCCESS” self-cert doc sprawl (Rule 9). Untrack root `coverage.out`.
 8. **Schedule a warm-cache - race + build pass** for the three timed-out/unverified surfaces — `helix_code` full build (resolve Asmt 5/11 vs Asmt 12 conflict), `internal/worker/consensus.go` election hang, `helix_agent internal/background/internal/streaming`, and `challenges pkg/runner/parallel.go/pkg/monitor/websocket.go` (Makefiles intend - race but it was not run this session). ## Sources verified Sources verified 2026-06-09: internal HelixCode consolidation/planning document — no third-party-service instructions; cross-referenced against project state (`docs/Issues.md`, `docs/Fixed.md`, `.gitmodules`, `docs/CONTINUATION.md`) as of 2026-06-09.
