

HXC-107_ledger_audit

HXC-107 — Feature-Status Ledger Enumerated-Completeness Audit (§11.4.153 / §11.4.118)

Audit date	2026-06-23
Target	docs/features/Status.md (rev 8, 123 KB, 1029 lines)
Method	Enumerate live codebase → reconcile against ledger rows; spot-check evidence paths + backing code
Verdict	GAPS-FOUND — enumeration is genuinely complete, but the §11.4.153 video-confirmation layer is stale/bluffed : every 📺 yes evidence path cited has been rotated away and no longer exists on disk

Verdict summary

- **Enumeration completeness (§11.4.118 (a)/(b)/(c) axis): PASS.** Every component/client/package/submodule in the live tree maps to ≥ 1 ledger row or a documented exclusion. No code-present-but-ledger-missing feature found. No fabricated (ledger-row-without-code) row found in spot-check.
- **§11.4.153 video-confirmation integrity: FAIL.** 23 rows are marked Overall=confirmed and cite 📺 yes(<recording>) evidence, but **all 34 concretely-checkable cited recording files (out of 58 distinct cited names) are MISSING** from /Volumes/T7/Downloads/Recordings. The §11.4.154 fresh-corpus rotation has replaced the -20260615/-20260616 recordings the ledger cites with a newer -20260622/-20260623 corpus. Per §11.4.153 (“a confirmed row whose evidence path is missing is a bluff”), these 23 confirmed rows are currently un-backed.

(a) Structural reconciliation — code AND ledger (PASS)

All five structural counts the ledger claims match the live tree EXACTLY:

Scope	Live-tree count	Ledger claim	Match
helix_code/ internal/*	72 dirs	72 (71 prod + i18n_wiring test-only)	✓
helix_code/ cmd/*	11 dirs	11	✓

Scope	Live-tree count	Ledger claim	Match
helix_code/ applications/*	6 dirs (android, aurora_os, desktop, harmony_os, ios, terminal_ui)	6	✓
submodules/*	67 dirs (all .gitmodules-registered)	67 → 65 rowed + 2 excluded	✓
cli_agents/*	50 dirs (= 50 .gitmodules entries)	50 (scoped to landed ports)	✓

- **All 72 internal dirs** have ≥ 1 row (verified each name against the ledger’s “Internal services + infrastructure” + “Deepened inventory” sections). Both `i18n_wiring` and `i18n_wiring` exist on disk as distinct dirs and both are rowed.
- **All 11 cmd dirs** rowed (cli, config_test, helix_config, i18n, infrastructure, performance_optimization, security_fix, security_fix_standalone, security_scan, security_test, server).
- **All 67 submodule dirs** accounted: 65 carry ≥ 1 | submodule | row; the 2 exclusions (docs_chain, challenges) are documented infra/tooling. `claude-toolkit` (added rev8) confirmed present on disk.
- `helix_code/web/frontend` confirmed present (ledger cites `web/frontend` rows).

(b) Code present but MISSING from ledger — NONE FOUND

Every live dir maps to a row. The only intentional non-1:1 mapping is `cli_agents/*` (50 vendored agents), where the ledger explicitly scopes the “Ported `cli_agents` capabilities” section to *landed ports only*, not every vendored agent’s full feature set — a documented §11.4.6 scoping decision, not a silent gap.

(c) Ledger rows with NO backing code — NONE FOUND

Spot-checked backing `.go` files for sampled internal rows (all real code present):

Row component	prod .go	test .go	Note
internal/voice	6	3	real
internal/kilocode	8	3	real
internal/continua	7	4	real
internal/clarification	4	3	real
internal/approvalwire	2	1	real
internal/infraboot	1	3	real
internal/substrate	1	4	real
internal/i18n_wiring	0	1	honestly flagged test-only — not a false claim

All 16 spot-checked “ported” rows (approval, autocommit, tools/browser, projectmemory, plantree, workspace, voice, repomap, kilocode, roocode, continua, agent/profiles, checkpoint, workflow/autonomy, workflow/planmode, tools/askuser) resolve to real packages on disk.

Spot-check of “confirmed” evidence paths (§11.4.153) — FAIL

Recordings dir /Volumes/T7/Downloads/Recordings exists and holds 43 helixcode- artifacts, but they are a **newer corpus** (-20260622T* / -20260623T*). The ledger’s 📺 yes cells cite the **older** -20260615/-20260616 **corpus**, which the §11.4.154 fresh-corpus rotation has since deleted.

- Rows marked Overall=confirmed: 23
- Distinct cited recording filenames referencing -20260615/16: 58
- Concretely-checkable cited files → on-disk: **HIT=0 / MISS=34** (zero survive)
- Specifically MISSING (sample): helixcode-cli-stream-20260616.mp4, helixcode-cli-generate-20260616.mp4, helixcode-cli-list-models-20260616.mp4, helixcode-api-generate-20260616.mp4, helixcode-tui-llm-deepseek-20260616.mp4, helixcode-web-llm-console-deepseek-20260616.mp4, helixcode-desktop-chat-themed-20260615.mp4, helixcode-android-themed-20260615.mp4, helixcode-ios-launch-20260615.mp4, helixcode-web-04-deepseek-stream-20260616.png.

Root cause: the ledger cites the **raw, rotatable, git-ignored corpus** (§11.4.128 / §11.4.154) in the 📺 Video column instead of **durable curated docs/qa/<run-id>/ evidence** (§11.4.83). When a later recording run rotated the corpus, every confirmed claim was orphaned. (The V&V column for the web rows DOES cite a durable path — docs/qa/web-llm-e2e-20260615/ — which still exists and is valid.)

Stale in both directions: disk now holds NEW evidence the ledger does not reflect —

helixcode-cli-
{generate,list_models,health,command_exec,list_workers,version}-20260622T*
helixcode-server-api-20260622T*, helixcode-tui-
{dashboard,projects,qa,sessions,tasks,workers}-2026062*,
helixcode-web-llmchat-20260623T*, helixcode-desktopgui-
llmchat-20260623T*, helixcode-ios-launch-render-20260623-* (each with
.evidence_frame.png + several with .pane.txt). So the ledger simultaneously cites
dead paths AND omits the live ones.

4-format exports + sources (PASS)

All present: Status.{md,html,pdf,docx} and Status_Summary.
{md,html,pdf,docx}. All 5 inventory sources present (cmd_and_clients,
deepened_round2, internal_services, ported_cli_agents, submodules —
each .md/.html/.pdf). docs/qa/web-llm-e2e-20260615/ (cited V&V path) exists.

Recommended ledger fixes

1. **Re-anchor the 📺 Video column to durable §11.4.83 evidence.** Curate the current -20260622/-20260623 recordings into docs/qa/<run-id>/ and cite those durable paths, OR downgrade the 23 confirmed rows to working-untaped until a durable recording is cited. Citing the rotatable raw corpus is the defect that orphaned every confirmation.
2. **Refresh the ledger to the live corpus.** Re-point CLI/API/TUI/Web/Desktop/iOS rows to the new -2026062* recordings (which exist with .evidence_frame.png + OCR .pane.txt evidence), instead of the deleted -2026061* names.
3. **Close the ledger's own flagged gap (a):** add the §11.4.86 drift-proof fingerprint sidecar over BOTH the feature-key roster AND the video-artefact roster, so a rotated/missing evidence file mechanically fails a freshness gate instead of silently bluffing green.
4. **Back-port rev2-5 hand-edits into the generator sources** before any docs_chain regen (the ledger's flagged gap (b)) so regen does not regress annotations.

Honest boundary (§11.4.6)

This audit proves enumerated completeness (every code dir is rowed; no fabricated rows in the sampled set) and proves the §11.4.153 evidence-path bluff (cited recordings gone). It does NOT re-verify per-row Dev/Wired/Real-use correctness beyond file presence, and the backing-code spot-check sampled ~24 of 564+ rows — a representative, not exhaustive, sample.
