

HXC-108_evidence_audit

HXC-108 — Recordable-Client Evidence Audit (§11.4.118 discovery / bluff-hunt)

Run-id	HXC-108_evidence_audit
Date (UTC)	2026-06-23
Auditor	subagent (respawn per §11.4.147), read-only
Mandate	Apply the HXC-107 skeptical lens (which caught rotated-away ledger recordings) to the 7 HXC-108 per-client evidence docs — confirm the recordable-client §11.4.158 coverage is genuinely backed by extant artifacts, not bluffed.
Method	Per doc: (1) extract every cited artifact path; (2) check existence in the committed docs / qa / tree AND the raw /Volumes/T7/Downloads/Recordings/ corpus; (3) where a cited filename is absent, md5-compare to detect content-present-under-different-name vs genuinely-missing; (4) confirm the self-validated OCR analyzer script + harness scripts exist.

Overall verdict

Recordable-client coverage is GENUINELY BACKED by real artifacts — NO content-loss bluff of the HXC-107 class was found. Every load-bearing md5 cited across CLI / desktop GUI / web / iOS / android matched a file on disk byte-for-byte. The self-validated analyzer (scripts/video_qa/record_feature.sh, 26 KB, golden-good/golden-bad wired) and all three cited harness scripts exist.

BUT there is a real, lower-severity ROTATION RISK and one filename-citation-drift finding: 6 of 7 docs cite the **rotatable git-ignored raw corpus** (/Volumes/T7/Downloads/Recordings/) as their sole artifact home — exactly the §11.4.154-rotation surface the HXC-107 audit flagged. Only the **android** doc moved its evidence to the durable committed docs/qa/HXC-108_android/ path. The raw corpus is one record_*.sh rerun (or §11.4.154 rotation) away from invalidating the other 6 docs' citations. The desktop-GUI doc additionally cites **stale filenames** (T110359Z) that no longer exist — the byte-identical content survives under newer timestamps (T155000Z), so it is drift, not loss, but the doc as written points at absent files.

§11.4.118 enumerated coverage — the 7 docs checked + each outcome

#	Doc	Verdict	Cited-artifact existence
1	HXC-108_cli_recordings_evidence.md	SOUND (rotation-risk)	6/6 MP4s present; version md5 6e2317... matches exactly
2	HXC-108_tui_server_recordings_evidence.md	SOUND (rotation-risk)	dashboard + server-api MP4s present; both timestamps match
3	HXC-108_desktopgui_features_evidence.md	OVER-CLAIM (filename drift)	cited * - T110359Z .mp4 MISSING; byte-identical content present as * - T155000Z .mp4 (dashboard c302e2b8..., tasks 327319062... md5-confirmed)
4	HXC-108_ios_evidence.md	SOUND (rotation-risk)	MP4 md5 e565c6bd... matches; 144 frames fprobe-confirmed; PNG present
5	HXC-108_web_evidence.md	SOUND (rotation-risk)	MP4 md5 ddf3eaf6... + evidence_frame PNG both match exactly
6	HXC-108_tui_views_evidence.md	SOUND (rotation-risk)	all 6 view MP4s + evidence_frame + pane.txt present (tasks/workers/sessions/projects/qa timestamps all match)
7	HXC-108_android_evidence.md	SOUND (best practice)	durable committed mp4+png present; committed mp4 byte-identical to

#	Doc	Verdict	Cited-artifact existence
			raw (b120f822...); 1080×1920/33f + 1080×1920 PNG ffprobe- confirmed

Findings (path evidence per finding; FACT unless marked)

F1 — DESKTOP-GUI doc cites stale filenames that no longer exist (OVERCLAIM / filename drift) — FACT

docs/qa/HXC-108_desktopgui_features_evidence.md cites all six tab MP4s as helixcode-desktopgui-<tab>-20260623T110359Z.mp4. **No T110359Z file exists** in /Volumes/T7/Downloads/Recordings/. The corpus instead holds T155000Z + T155035Z variants (a later regeneration). Severity-reducing FACT: the cited **md5s match the T155000Z files byte-for-byte** — dashboard cited c302e2b8a032f62384a468d1c54e0c95 = helixcode-desktopgui-dashboard-20260623T155000Z.mp4; tasks cited 327319062af6a51de55f15d7ec16fca3 = BOTH T155000Z and T155035Z. So the **content is present and provably the same**; only the doc's filename pointers are stale. This is filename-citation drift (the doc points at absent files), NOT the HXC-107 content-loss bluff. Fix: update the six filenames to T155000Z (or re-pin to whatever the regeneration left), or move the MP4s to a durable docs/qa/HXC-108_desktopgui/ path.

F2 — 6 of 7 docs anchor evidence ONLY in the rotatable raw corpus (ROTATION RISK) — FACT

CLI, tui_server, desktopgui, ios, web, tui_views all cite /Volumes/T7/Downloads/Recordings/ (git-ignored §11.4.128, §11.4.154-rotatable) as the sole artifact location. None of their MP4s/PNGs are committed under docs/qa/. The android doc explicitly contrasts this: *"Durable evidence committed under docs/qa/HXC-108_android/ ... NOT the rotatable git-ignored raw corpus — the exact §11.4.154-rotation bluff the HXC-107 audit caught."* The other 6 docs did not adopt that fix. **They are SOUND today** (every artifact verified present), but a single harness rerun or rotation invalidates every citation — the same fragility HXC-107 flagged. Recommended: copy the load-bearing MP4 + evidence_frame for each of the 6 into a committed docs/qa/HXC-108_<surface>/ per the android pattern.

F3 — analyzer + harness scripts genuinely exist (NOT a bluff) — FACT (positive)

scripts/video_qa/record_feature.sh exists (26202 bytes, 26 hits for selftest/golden-good/golden-bad/ocr-analyze), so the §11.4.107(10) self-validation claimed across every doc is backed by a real script. record_tui_views.sh + record_gui_features_inprocess.sh (cited by docs 7 and 3) both exist. No analyzer-self-validation over-claim found.

F4 — claimed “real output” results are concrete + falsifiable (NOT vague) — FACT (positive)

Spot-checked the load-bearing assertions; all are specific and unfalsifiable-if-fake: CLI generate tokens: in=17 out=18 ... finish: stop + answer 4; CLI command-exec expr 6 * 7 = 42 (real os/exec, cannot be print-and-sleep); iOS Go core OK - themes: 3, tasks: 2; web HELIXCODE_WEB_OK4 + tokens=146 finish=stop; android ResumedActivity: dev.helix.code/.MainActivity + APK md5 match. These are concrete enough that a faked PASS would be detectable — no vague “renders correctly”-class claims.

F5 — docs are HONEST about their gaps (NOT over-claiming completeness) — FACT (positive)

Each doc carries explicit §11.4.3 SKIP/limit sections: CLI SKIPs streaming + -qa-run (server-gated); tui_server documents the TUI interaction limit + the asciinema TCC env-gap; desktopgui notes dialogs-not-driven; web surfaces a REAL upstream DeepSeek-502 finding rather than hiding it; tui_views honestly states a transient throttle killed the agent before the analyzer ran and the conductor finished validation directly; ios documents the CoreSimulator noowners blocker. No doc claims more than it shows.

F6 — md5/frame integrity of the durable android artifacts (positive control) — FACT

The one doc that did it right verifies cleanly: committed docs/qa/HXC-108_android/helixcode-android-client.mp4 is byte-identical (b120f8222a286b3534cde4a15e469a86) to the raw-corpus original, ffprobe confirms H.264 1080×1920 / 33 frames, and the key PNG is 1080×1920. The android doc’s claims are fully backed by committed, non-rotatable evidence.

Durable-vs-rotatable summary (the §11.4.154 axis)

- **Durable (committed, rotation-proof):** HXC-108_android_evidence.md only.
- **Rotation-risk (raw corpus only):** the other 6 — cli, tui_server, desktopgui, ios, web, tui_views.

Conclusion

The HXC-108 recordable-client evidence is **real and presently backed** — no HXC-107-class content-loss bluff. The bluff-hunt surfaced (a) one filename-drift over-claim (desktop GUI cites absent T110359Z files; byte-identical content lives under T155000Z), and (b) a systemic rotation RISK: 6 of 7 docs rely on the git-ignored raw corpus the android doc deliberately avoided. Both are honest-state findings to remediate before relying on these docs at a release gate, not evidence of fabrication.
