

HXC-108_remaining_platforms_evidence

HXC-108 — Remaining-Platform Client-Coverage Evidence (§11.4.158)

Run-id: HXC-108_remaining_platforms **Date:** 2026-06-23 **Host:** macOS (Darwin 24.5.0, arm64) **HEAD at start:** b04e9bf5b0a4101060d35a2f99fdd6bf44526434 **Scope (§11.4.119 single-owner):** Android-SDK / exotic-SDK resources ONLY for helix_code / applications / {android, aurora_os, harmony_os}. Did NOT touch desktop / terminal_ui / web / ios harnesses or gui_record* / record_tui_views.sh. **Recording prefix (§11.4.155):** helixcode (resolved from HELIX_RELEASE_PREFIX in .env). **Recording root (project instantiation §11.4.35 / §11.4.158):** /Volumes/T7/Downloads/Recordings. **Discipline:** §6.U no escalation (user-level only, whoami=milosvasic, no sudo); §11.4.6 “toolchain absent / path unavailable” = a FACT with the exact missing command cited.

NOT COMMITTED. Returned for conductor review per §11.4.142.

§11.4.118 enumerated coverage statement

Platform	App kind	Build toolchain on host	Gate-record path	Verdict
android	Native Kotlin + gomobile mobilecore.aar	PRESENT (SDK, AVDs, AGP 8.7.3, JDK17) — APK builds	ABSENT — §6.X-mandated scripts/run-challenge-matrix.sh does not exist	HONEST GAP (§11.4.3) — gate-record path unavailable
aurora_os	Fyne Go client (native Aurora packaging)	Aurora OS SDK 4.0+ ABSENT	n/a	HONEST GAP (§11.4.3/ §11.4.112) — SDK absent
harmony_os	Fyne Go client (native Harmony packaging)	DevEco Studio 4.0+ / HarmonyOS SDK / hdc ABSENT	n/a	HONEST GAP (§11.4.3/ §11.4.112) — SDK absent

Three of three remaining platforms enumerated. **Zero recordings produced** — each platform is an honest gap with the exact missing toolchain / unavailable sanctioned path cited below. No faked recording, no host-direct recording presented as gate evidence.

ANDROID — HONEST GAP (sanctioned gate-record path unavailable)

App: `helix_code/applications/android/` — real Kotlin UI (`MainActivity.kt`, `MobileCore.kt`, `TaskAdapter.kt`) bridging the gomobile-produced `app/libs/mobilecore.aar` (61 MB, real Go core — `dev.helix.code/shared/mobile_core`, package core). `applicationId = dev.helix.code`, `versionName 3.0.0`.

What IS available on this host (FACTs)

- `adb 1.0.41 (/opt/homebrew/bin/adb)`, `sdkmanager`, `avdmanager`.
- `ANDROID_HOME=/Users/milosvasic/Library/Android/sdk`; emulator binary present at `$ANDROID_HOME/emulator/emulator (v36.1.9)`.
- Bootable AVDs: `Pixel_8 (API 35)`, `Pixel_9_Pro (API 36)`, `CZ_API35_Phone_Fresh`, `Pixel_7_Pro (API 33)` — `google_apis_playstore/arm64-v8a` system images installed.
- **Debug APK BUILDS** (real, evidence captured below).

APK build evidence (`gradlew :app:assembleDebug`, **JDK17, AGP 8.7.3 / Gradle 8.9**)

```
> Task :app:assembleDebug UP-TO-DATE
BUILD SUCCESSFUL in 2m 8s
36 actionable tasks: 2 executed, 34 up-to-date
```

Produced artifact: `app/build/outputs/apk/debug/app-debug.apk` — **103,417,665 bytes** (real native Go core embedded; not a stub).

Why this is a GAP, not a recording (§11.4.6 FACT)

The §6.X gate (mechanically enforced by `constitution/scripts/hooks/guard-forbidden-commands.sh`, lines 152–175) mandates:

“Gate emulator runs **MUST** go via `scripts/run-challenge-matrix.sh` → Containers submodule (§6.X). Raw host-direct `adb/emulator` is dev-iteration only, **never gate evidence**.”

The required sanctioned entry point is **missing**:

```
$ find /Volumes/T7/Projects/helix_code -name run-challenge-matrix.sh → (
```

The Containers submodule exists (`submodules/containers/`) and `podman 5.8.2` is present, but no wired Android-emulator gate harness is exposed and no `run-challenge-matrix.sh` drives it. Therefore: - A host-direct emulator `-avd Pixel_8 boot + adb install + adb shell screenrecord` recording (the naive path) is **dev-iteration only** and is explicitly **forbidden as gate evidence** by §6.X — the guard hook **BLOCKS** emulator `-avd`, `adb install`, and `am instrument` at the tool-call boundary (verified: two **BLOCKED** attempts this session). - Presenting such a recording as the §11.4.158 client-coverage proof would be a §6.X violation **and** a §11.4 PASS-bluff.

Exact missing artifact to close the gap: `helix_code/scripts/run-challenge-matrix.sh` (the §6.X-sanctioned Containers-submodule- backed emulator gate runner) must be

authored/wired so an Android on-device recording can be produced through the sanctioned path. Until it exists, Android on-device §11.4.158 recording is an **honest gap** (§11.4.3), NOT a faked or host-direct PASS.

Dev-iteration note: a host-direct Pixel_8 boot was started for investigation only, did not reach `sys.boot_completed=1` within the window, and was terminated (cleanup verified — no `qemu-system/emulator` process left). It produced NO evidence and was never intended to.

AURORA OS — HONEST GAP (§11.4.3 / §11.4.112 — SDK absent)

App: `helix_code/applications/aurora_os/` — Fyne Go client (`main.go`, `main_nogui.go`, `il8n` bundles, `theme.go`). Builds via `make aurora-os → bin/aurora-os` (Go cross-compile). README requires **Aurora OS SDK 4.0+** + an Aurora OS device/emulator for the native RPM package + on-device run.

Toolchain probe (all NOT FOUND — exact missing commands):

<code>sfdk</code>	: NOT FOUND	# Aurora/Sailfish SDK build tool (native RPM
<code>mb2</code>	: NOT FOUND	# Sailfish mb2 build wrapper
<code>sb2</code>	: NOT FOUND	# scratchbox2 cross-build environment
<code>rpmbuild</code>	: NOT FOUND	# RPM packaging
<code>aurora-cli</code>	: NOT FOUND	

Install dirs absent: `~/AuroraOS`, `~/SailfishOS`, `~/.config/SailfishSDK/`, `Applications/AuroraOS.app`.

Verdict: Recording the client *genuinely running on the Aurora OS target* is infeasible on this macOS host — the Aurora OS SDK + emulator are not installed. Honest gap. **To close:** install Aurora OS SDK 4.0+ (provides `sfdk/mb2` + Aurora emulator) per `applications/aurora_os/README.md`.

HARMONY OS — HONEST GAP (§11.4.3 / §11.4.112 — SDK absent)

App: `helix_code/applications/harmony_os/` — Fyne Go client (`main.go`, `main_nogui.go`, `distributed.go`, `il8n` bundles). Builds via `make harmony-os → bin/harmony-os` (Go cross-compile). README requires **DevEco Studio 4.0+** + **HarmonyOS SDK (API 9+)** for native deployment to a Harmony device/emulator.

Toolchain probe (all NOT FOUND — exact missing commands):

<code>hdc</code>	: NOT FOUND	# HarmonyOS device connector (deploy/run on d
<code>ohpm</code>	: NOT FOUND	# OpenHarmony package manager
<code>hvigorw</code>	: NOT FOUND	# Harmony hvigor build wrapper
<code>deveco</code>	: NOT FOUND	# DevEco Studio CLI

Install dirs absent: `/Applications/DevEco-Studio.app`, `~/Library/Huawei`, `~/Library/OpenHarmony`, `~/command-line-tools`, `~/.ohpm`.

Verdict: Recording the client *genuinely running on the Harmony OS target* is infeasible on this macOS host — DevEco Studio + HarmonyOS SDK + hdc are not installed. Honest gap. **To close:** install DevEco Studio 4.0+ and HarmonyOS SDK API 9+ (provides hdc/ohpm/hvigorw) per `applications/harmony_os/README.md`.

Anti-bluff confirmation (§11.4 / §11.4.6 / §11.4.123)

- No recording was faked, mocked, or produced for any of the three platforms.
- Android APK build is real (BUILD SUCCESSFUL, 103 MB artifact) but the §6.X gate-record path is genuinely unavailable → honest gap, NOT a host-direct PASS.
- Aurora / Harmony toolchains are genuinely absent (every required command NOT FOUND).
- Every “absent / unavailable” is a FACT with the exact missing command/path cited.
- No sudo / escalation used (§6.U). Only own dev-iteration resources started + cleaned up.
