

RETRO_LEDGER

docs/qa Retro-Capture Ledger — §11.4.83 G7 gap close

Created 2026-06-16 vs HEAD 9e6e0458 (9e6e0458f93b7e50ee6d47d8324b34f02e77b31c).

This ledger closes the §11.4.83 docs/qa/<run-id>/ evidence gap (G7) **honestly**, by RE-CAPTURING FRESH real end-to-end evidence from the running current System on 2026-06-16. No historical transcripts were fabricated (§11.4.6 / §11.4.123). Every retro-captured run is a CURRENT run, explicitly labelled as such in its run-id README — never claimed as the original feature-shipping evidence.

Scope of this stream: docs/qa/ additions ONLY. No source, no constitution submodule, no docs/Fixed.md / docs/Issues.md / docs/workable_items.db, no tests/integration files were touched. No push.

A. Enumeration (in-scope vs deferred)

The existing docs/qa/ tree is largely bug-fix-tracker-keyed (HXC-NNN) plus a handful of feature-keyed run-ids (g2-live-boot, web-llm-e2e, tui-ensemble-*, all-providers-keys-integration, real-dial, W6B, ...). The significant shipped user-visible features lacking a docs/qa entry, and their disposition this round:

Retro-captured FRESH this round (runnable now, CLI path)

Feature	run-id	Status
Real LLM generate + models-list (CONST-036) + health	retro-cli-llm-generate-20260616	✅ captured, real DeepSeek output
/specify (real multi-agent SpecKit) + /debate	retro-cli-specify-debate-20260616	✅ captured, real 3-round LLM debates
Streaming generate (-stream)	retro-cli-stream-generate-20260616	✅ captured, real streamed output
Edit-safety /diff + /checkpoint + /undo	retro-cli-edit-safety-20260616	✅ captured — surfaced a real defect (see §C)

Deferred — NOT reproducible headlessly now (honest, per §11.4.3 / §11.4.6)

Feature	Original ship (commit)	Why not reproducible in this stream	Classification
Desktop Fyne GUI (TUI parity)	47ee1ed7	Needs a GUI window + macOS TCC	NEEDS-GUI / operator-attended

Feature	Original ship (commit)	Why not reproducible in this stream	Classification
		screen-capture grant; not driveable from a headless background stream.	
HelixCode logo + dark theme across 6 clients	f9c6ab06	Purely visual across GUI surfaces; needs window capture.	NEEDS-GUI
Web /specify UI (frontend)	7a3fec7d	Needs a browser/chromedp drive; pairs with existing web-11m-e2e harness but out of this stream's lightweight scope.	NEEDS-GUI
iOS / Android buildable apps (HXC-109)	38caa48d, 57b4dbcd	Needs Xcode simulator / Android emulator hardware.	NEEDS-HW
Mobile gomobile Generate() binding	28465071	Needs gomobile bind + on-device call.	NEEDS-HW
harmony_os / aurora_os real chat	38612f24, f8e14e29, ...	Platform-specific; nogui path partially CLI but OS targets need their runtime.	NEEDS-HW
Server POST /api/v1/specify (HXC-105)	d7dffa14	Runnable-now-API, but booting a server collides with concurrent streams (8111 helixagent already up; 8080 deliberately not booted to avoid cross-stream interference). Deferred to an operator/dedicated stream; the CLI /specify (same SpecKit engine) IS captured this round.	RUNNABLE-API / deferred-to-avoid-collision
Infra: full-test distributed to nezha (containers remote-compose)	13a32796	Needs remote creds + would restart shared nezha services another stream uses (forbidden by this stream's scope).	NEEDS-CREDS / shared-resource

Deferred items are honest coverage gaps, not failures — recorded here per §11.4.3 / §11.4.6 rather than faked.

B. Provider used

DeepSeek (HELIX_LLM_PROVIDER=deepseek, keys from ~/api_keys.sh). Real provider responses with real token accounting captured throughout.

C. Real defect surfaced by retro-run (anti-bluff finding)

/checkpoint restore prints an unconditional  working tree restored to checkpoint <id> even when the git-backend checkpoint did NOT restore the content — specifically for git-**untracked** working-tree files, which the git-backend never snapshots. Tracked-file restore works correctly; untracked files stay corrupted while the user sees a green “restored” message. Fully characterized (tracked-vs-untracked controlled comparison + git ls-tree proof) in docs/qa/retro-cli-edit-safety-20260616/cli_checkpoint_restore_isolated.txt. Reported to the conductor for tracker filing; source fix is out of this stream’s scope.

D. Quiescence (§11.4.84)

After all captures: HEAD unchanged at 9e6e0458; the only working-tree changes are this stream’s docs/qa/retro-* additions + this ledger. The pre-existing m constitution and another stream’s ?? .../project_idor_realpg_test.go are NOT this stream’s. Transient .helix/ checkpoint working dir and the isolated temp git repo created during capture were removed. Zero stray files left behind.
