Retro-capture: CLI /specify + /debate (real multi-agent LLM-backed SpecKit)

Retro-captured 2026-06-16 vs HEAD 9e6e0458
(9e6e0458f93b7e50ee6d47d8324b34f02e77b31c). Fresh CURRENT run on the running System — explicitly a retro-capture on 2026-06-16, NOT original/historical evidence (§11.4.6 / §11.4.123). Backfills the §11.4.83 docs/qa gap (G7) for the shipped /specify and /debate REPL commands (helix_code/cmd/cli/main.go).

What was exercised (real end-user CLI REPL path)

Provider: DeepSeek. Driven by feeding the slash-command + /exit to the interactive REPL (the same path a user types).

File	Feature	Real result
cli_specify_run.txt	/specify a small CLI tool that converts a CSV file to JSON	Real SpecKit Specify phase: 3-round structured debate, 2 real DeepSeek agents producing genuine specification content, Completed phase duration=1m22.19s phase=specify score=1.000. Real CONCLUSION emitting a concrete CSV→JSON tool spec (flags, RFC-4180 parsing, streaming, error policy).
cli_debate_run.txt	/debate tabs vs spaces for code indentation	Real 3-round LLM-backed debate, 2 DeepSeek participant agents with per-agent confidence, Quality score: 0.925, Success: true, genuine FOR/AGAINST/ SYNTHESIS argument content.

Anti-bluff notes

- Both runs are REAL multi-agent LLM calls — the transcripts contain genuine, non-templated argument prose and a real per-phase duration (1m22s for /specify), proving these are live model calls, not canned text (§11.4.2).

- Quiescence (§11.4.84): `git_auto_commit: enabled=true` is logged at startup, but `/specify //debate` edit no files, so HEAD stayed 9e6e0458 and no auto-commit occurred — verified post-run.
