

p1-5-dedup-canonical

Phase 1.5 — Submodule Deduplication: Canonical Paths

Captured: 2026-05-06 **Source:** Plan docs/superpowers/plans/2026-05-06-p1-5-foundation-cleanup.md §WP1.T01.04 **Purpose:** WP3 reads this file to know which copy stays and which copies are removed.

The 5 dedup sets

#	Submodule	Canonical path	Removed paths	Consumers to update
1	LLMsVerifier	submodules/ llms_verifier/ (root)	helix_agent/ LLMsVerifier/	helix_agent/ Makefile, helix_agent/ scripts/*, any internal/... refs to old path
2	containers	containers/ (root)	challenges/ containers/ helix_agent/ containers/ helix_agent/ HelixLLM/ submodules/ containers/	Each removed parent's Makefile + nested verifier scripts (per-WP2 audit)
3	Security	security/ (root)	helix_agent/ security/ helix_agent/ HelixLLM/ submodules/ security/ (if present)	helix_agent/ scripts/security- *.sh, root cmd/ security_test wiring
4	helix_qa	helix_qa/ (root)	helix_agent/ helix_qa/	helix_agent/ Makefile test wiring; root scripts/run- all-tests.sh
5	mcp_servers	TBD at WP3.T03.05 — current candidates: mcp_servers/ (root, may not	TBD per resolution	TBD per resolution

#	Submodule	Canonical path	Removed paths	Consumers to update
		exist), helix_agent/ mcp_servers/, helix_agent/ MCP/ submodules/... (per-server)		

Note on set #5 (MCP-Servers): The HelixAgent submodule tree has both `mcp_servers/` (potentially a single aggregator) and `MCP/submodules/<NAME>/` (per-server child entries: `airtable-mcp`, `all-in-one-mcp`, `atlassian-mcp`, etc.). Whether these are duplicates or whether `mcp_servers/` is *the* aggregator that links the per-server entries is not resolvable from `.gitmodules` alone — the plan defers the canonical decision to WP3.T03.05 with audit-at-execution.

Dependency edges (read these BEFORE WP3)

- LLMsVerifier dedup blocks WP3 until make `verify-llmsverifier-pin-parity` is reproduced from the new canonical path.
- containers dedup affects all three Helix* submodules; per-removal rebuild required (T03.0X completion gate).
- helix_qa dedup affects HelixAgent’s test wiring; integration test must still pass post-dedup.
- mcp_servers TBD blocks any consumer code that imports MCP servers (CONST-040 capability flags) until canonical chosen.

Rollback per dedup

For each canonical decision, the rollback is:

```
cd <parent-of-removed-path>
git submodule add -f <url-from-captured-snapshot> <removed-path>
git submodule update --init --recursive <removed-path>
```

URLs are captured in `docs/improvements/p1-5-snapshot-pre.md` and the verbatim `.gitmodules` content snapshots referenced from there.

What this list does NOT decide

- Per-removal commit ordering (left to WP3 task graph).
- Whether to also dedup any `MCP/submodules/<NAME>` entries where a root-level copy now exists (audit at WP3.T03.05).
- Whether `Toolkit/Toolkit/Chutes` (a dup-path-typo seen in HelixAgent `.gitmodules`) is fixed in WP3 or in WP2 restructuring — owned by WP2.
