

p1-5-snapshot-pre

Phase 1.5 Pre-State Snapshot — Foundation Cleanup

Captured: 2026-05-06T16:29 +03:00 **Purpose:** Reversibility anchor per Article XI §11.9. Any later WP that breaks the submodule tree must be diagnosable + rollback-able from this file.

WP1 status at capture: Pre-WP1 cleanup complete (HelixAgent gitlinks committed, Challenges gitlinks committed, root tracked changes committed, Example_Projects/ fully removed, .gitignore updated). Recursive `git submodule update --init` ran but ABORTED with three unreachable remotes (see §Reachability). T01.01 evidence is partial (160/196 submodules accounted for; init aborted by HelixAgent DebateOrchestrator double-failure). Halted at user STOP-protocol checkpoint.

Initial commit-set (root meta-repo) — pre-WP1 state

Step	Commit SHA	Message
1a (HelixAgent)	aad6a67d	chore(governance-cascade): preserve in-flight nested gitlink updates pre-P1.5
1b (Challenges)	47dc905a	chore(P1.5): preserve nested gitlink updates pre-foundation-cleanup
1c (root)	d0ad6fd3	chore(P1.5): preserve in-flight tracked changes + submodule gitlink advances pre-foundation-cleanup
2 (Examples)	ad5e108c	feat(P1.5-pre): remove Example_Projects/ entirely
3 (gitignore)	cff2d90f	chore(P1.5-pre): gitignore phase-1 development artefacts

Root HEAD at capture: `cff2d90fe550fe069eb3632b7074c412e69c6ddb` (main).

Submodule counts (post-init, pre-fetch-loop)

Scope	Initialised	Uninitialised	Total
Whole tree (<code>git submodule status --recursive</code>)	~160	36	~196
Root meta-repo <code>.gitmodules</code>	21		21

Scope	Initialised	Uninitialised	Total
HelixAgent .gitmodules	~134	36	170

Top-level uninitialised: helix_agent/DebateOrchestrator (unreachable), helix_agent/HelixLLM/submodules/* (~33 entries deferred since Phase 0), helix_agent/cli_agents/{kiro-cli,ollama-code} (unreachable upstream).

Captured listing: docs/improvements/p1-5-fetch.log (init log) and docs/improvements/p1-5-remote-reachability.md (per-URL ls-remote result).

Reachability — the WP1 STOP

Comprehensive ls-remote sweep across 181 unique URLs (root + HelixAgent combined) found **3 truly unreachable remotes** (after a 30s-timeout retry to filter 2 false-positives caused by 15s-timeout flake on cold SSH sessions):

Submodule (HelixAgent path)	URL	Status	Disposition
helix_agent/ DebateOrchestrator	git@github.com:vasic-digital/ DebateOrchestrator.git	UNREACHABLE	vasic-digital owned — repo missing/never-created. Needs user decision: create vs delete.
helix_agent/ cli_agents/kiro-cli	git@github.com:stark1tty/ kiro-cli.git	UNREACHABLE	Third-party fork deleted upstream. Already in Phase 0 §3.3 parking lot.
helix_agent/ cli_agents/ollama-code	git@github.com:tcsenpai/ ollama-code.git	UNREACHABLE	Third-party repo deleted upstream. Same parking-lot disposition.

git submodule update --init --recursive aborted on DebateOrchestrator (double-failure-aborts behaviour). The pull-loop (foreach --recursive ... git fetch + git pull --ff-only) ran against ~155 initialised submodules in sequence, then was killed at helix_agent/cli_agents/HelixCode (a circular self-reference whose HEAD is refs/heads/.invalid and therefore non-fetchable — scheduled for removal in plan T02.01).

Pull-loop log: docs/improvements/p1-5-pull.log (548 lines, ~155 submodules processed before kill).

Per user STOP protocol, WP1 is halted here pending user decision on the 3 unreachable remotes. Reachability detail in docs/improvements/p1-5-remote-reachability.md.

.gitmodules content (root meta-repo, post-Example_Projects removal)

Root .gitmodules is now 63 lines (was 264 lines pre-removal). All 67 Example_Projects/. . . blocks removed; remaining entries: - Challenges, HelixAgent, HelixQA, Containers, Security, Assets, Github-Pages-Website, dependencies/{LLama_CPP, Ollama, HuggingFace_Hub}.

HelixAgent .gitmodules unchanged: 170 submodules across cli_agents/, MCP/, HelixLLM/submodules/, Toolkit/, Veritas, VisionEngine, etc.

Dirty-state per submodule (post-init)

git status at root reports M HelixAgent only — the bare M reflects the -dirty suffix on HelixAgent's gitlink because HelixAgent has nested unstageable submodule modifications cascade. No tracked-modified files at root after the 5-commit pre-WP1 cleanup.

Inside HelixAgent: 94 nested gitlinks still show -dirty because their own inner submodules carry uncommitted work (the intentional “preserve in-flight state” from Step 1a above). These dirty-trees are committed at the HelixAgent gitlink-pin-bumping level (aad6a67d) but the inner submodule WIP was not walked deeper — by user mandate.

Decided canonical paths for WP3 dedup (placeholder — populated by T01.04)

See docs/improvements/p1-5-dedup-canonical.md.

Rollback recipe

If WP2/WP3 breaks the submodule tree:

```
cd /run/media/milosvasic/DATA4TB/Projects/HelixCode
# 1. Restore root meta to pre-WP1
git reset --hard cff2d90f
git submodule sync --recursive
git submodule update --init --recursive --force

# 2. Restore HelixAgent to its pre-WP1 commit
cd HelixAgent
git reset --hard aad6a67d
git submodule sync --recursive
git submodule update --init --recursive --force
cd ..
```

```
# 3. Restore Challenges to its pre-WP1 commit
```

```
cd Challenges
```

```
git reset --hard 47dc905a
```

```
cd ..
```

```
# 4. Re-add the four root remotes if any push partially landed
```

```
git remote -v # confirm origin/github/gitlab/upstream all  
present
```

The destructive `--hard` is intentional for rollback. Do NOT run unless WP2/WP3 left the tree unrecoverable.

Open issues at this snapshot

1. Three unreachable remotes (DebateOrchestrator, kiro-cli, ollama-code). See §Reachability.
WP1 STOP — user decision required.
2. HelixAgent has 94 nested `-dirty` gitlinks. Captured in commit `aad6a67d` but not walked deeper.
3. `helix_agent/HelixLLM/submodules/*` (~33 entries) remain uninitialised from Phase 0 — out of scope for P1.5.
4. Recursive `fetch+pull-loop` (T01.01 second half) was started but is still running at capture; partial output in `/tmp/p1-5-pull.log`.
