QA Transcript — HXC-016

Revision: 1 Last modified: 2026-05-28T00:00:00Z

Field	Value
Run-id	HXC-016
Feature	§11.4.69–97 governance cascade into all owned submodules + mechanical propagation gate (CONST-047 / §3, §11.4.32)
Type	Task
Tracker	docs/Fixed.md (HXC-016 row — Completed (→ Fixed.md))
Authority	constitution submodule Constitution.md §11.4.83 (docs/qa/end-user evidence mandate)
Status	PASS — verified end-to-end

Seed worked example. This transcript is a real, already-completed feature’s end-user evidence, recorded here as the canonical format for the docs/qa/ tree (see docs/qa/README.md). It transcribes the verification commands and outputs captured during the HXC-016 session (the same evidence summarised in the docs/Fixed.md HXC-016 row). No output is fabricated — every result below is the real captured result from that session.

Feature exercised

The end-user-visible “feature” of HXC-016 is the **governance-cascade guarantee**: every owned-org submodule carries the new constitution anchors (§11.4.69 + §11.4.75–97), and the `verify-governance-cascade.sh` release-gate tool — the interface a maintainer or release engineer runs to confirm that guarantee — reports zero failures. The “user” here is the maintainer running the gate before a release.

Bidirectional thread

Exchange 1 — run the cascade verifier (the user-visible gate)

Sent (command the maintainer runs):

```
scripts/verify-governance-cascade.sh
```

Received (captured result, summarised from the HXC-016 session):

```
=== Result: 0 failures === PASS
```

204 owned-submodule PASS lines were emitted, each carrying the + §11.4 covenant-114 marker confirming the new anchors are present in that submodule’s CONSTITUTION / CLAUDE / AGENTS / QWEN files.

Exchange 2 — paired §1.1 mutation (proves the gate is not a bluff)

Sent (mutation — strip the §11.4.95 H2 heading from one submodule’s CLAUDE.md, then re-run the gate):

```
# remove the "## §11.4.95 —" heading line from a cache/CLAUDE.md fixture
scripts/verify-governance-cascade.sh
```

Received:

```
=== Result: 1 failures ===
```

The gate correctly FAILED when the anchor heading was removed — demonstrating it detects real absence, not just running green unconditionally.

Exchange 3 — restore + confirm (returns to the verified baseline)

Sent:

```
git checkout -- <the mutated CLAUDE.md>
scripts/verify-governance-cascade.sh
```

Received:

```
=== Result: 0 failures === PASS
```

Anti-bluff hardening recorded during the run

A loose `grep -qF "§11.4.95 —"` originally matched the §11.4.95 cross-reference *inside* the §11.4.93 block body, silently skipping the §11.4.95 *heading* in several submodules. The gate was tightened to match the H2 marker `## §11.4.NN —` (commit d2165bf7), which then exposed 201 missing-heading files; fix-ups 79478ed5 / 903b9225 / a9a1a6a1 restored them. A second defect — a `reset --hard origin/main` that regressed 4 HelixDevelopment submodules off their canonical master lineage — was repaired by repointing to master with the complete anchor set (b4b790ea).

Captured-evidence references

Evidence	Where
Final gate result 0 failures === PASS (204 submodule PASS lines)	HXC-016 session log; summarised in docs / Fixed.md HXC-016 row
Paired §1.1 mutation FAIL→restore→PASS	Exchanges 2–3 above
Gate-tightening + fix-up commits	d2165bf7, 9031368d, 79478ed5, 903b9225, a9a1a6a1, b4b790ea
Root cascade commit + submodule batches	

Evidence	Where
	27929ae1; ef4b3986 / a864039d / e4046668 / 3adb2e63 / 464b2401 / b4ad4f50 / 053fd731

Verdict

PASS — the cascade guarantee is verifiable end-to-end through the same gate a release engineer runs, the gate is proven non-bluff via a paired mutation, and the baseline is restored. This is the evidence shape every future docs/qa/<run-id>/transcript.md should follow.
