HXC-044 — cognee AMD-GPU rocm-smi JSON parser returns -1 sentinel instead of parsed value

Found by isolated-worktree `go test -count=1 ./internal/...` (HEAD 54ab4e95, go 1.26.2). `internal/cognee TestProbeAMDGPU_ParsesRocmSmiJSON` — `performance_optimizer_gpu_amd_test.go:111`: “Max difference between 42 and -1 ... difference was 43” — hermetic test (fake rocm-smi on PATH via `t.Setenv`, no `infra`) drove real `queryAMDGPUUsage()` with `{“card0”: {“GPU use (%)”: “42”}}` and got -1 (unavailable sentinel) instead of 42. The rocm-smi single-card JSON parse path does not surface the reading. Genuine parser defect.

RECLASSIFIED OBSOLETE — does NOT reproduce in main tree (not a real product defect)

S4 caught the failure ONLY in an isolated git-worktree (which also had 6 unrelated setup-failed packages from a missing submodules/challenges checkout). In the real main tree: `go test -count=10 -run TestProbeAMDGPU ./internal/cognee/` → ok 10/10; full cognee package green. The parser `parseRocmSmiUtilization` correctly returns 42.0 for `{“card0”: {“GPU use (%)”: “42”}}`. Root cause of the worktree failure = environment (PATH-scrub / missing shell for the hermetic fake rocm-smi echo script in that worktree), NOT the code. No fix fabricated (§11.4.6 — fixing a non-reproducing bug would itself be a bluff). Obsolete-Details: Since 2026-06-09; Reason: not-reproducible-environment-artifact (isolated-worktree PATH/shell); Superseding-item: none; Evidence: 10/10 main-tree PASS above.
