HXC-045 — hooks cancelled-execution result missing duration

internal/hooks TestExecutionResultCancelAndSkip/Cancel — hooks_test.go:1407: “expected duration to be set”. In-process, no infra. A cancelled hook execution result leaves duration unset; the field should always be populated (result-bookkeeping bug). Found by isolated-worktree full unit sweep (HEAD 54ab4e95).

FIXED — flaky-timing root cause + deterministic source fix (§11.4.50/§11.4.1)

Reproduced as FLAKY: TestExecutionResultCancelAndSkip/Cancel passed 3/3 on retry but S4 caught it FAIL once — an instant Cancel() right after NewExecutionResult yields CompletedAt-StartedAt rounding to 0 on fast hardware, tripping the test’s `Duration == 0` assertion. FIX (hook.go Complete + Cancel): floor Duration to `time.Nanosecond` when the measured monotonic delta is `<=0` — a completed/cancelled execution genuinely took positive time below clock resolution; Skip() keeps Duration=0 (not executed). GREEN deterministic: -count=50 PASS; full hooks pkg ok.
