HXC-046 — generateThreadID() non-unique under fast back-to-back calls (uniqueness contract violated)

internal/memory/providers TestGenerateThreadID — zep_provider_test.go:628: Should not be: “thread-1781003815158614000” — two consecutive generateThreadID() calls returned IDENTICAL IDs because the generator derives the ID purely from a nanosecond timestamp; on fast Apple Silicon both landed in the same nanosecond. Fix: add a monotonic counter / entropy suffix. Deterministically reproducible. (HEAD 54ab4e95)

FIXED — RED→GREEN

RED (S4 capture): TestGenerateThreadID zep_provider_test.go:628 “Should not be: thread-1781003815158614000” (two calls identical). FIX: added package-level `var threadIDCounter atomic.Uint64`; generateThreadID now returns “thread-%d-%d” (UnixNano, threadIDCounter.Add(1)) — unique even within the same nanosecond. +import sync/atomic. GREEN (this session): `go test -count=1 -run TestGenerateThreadID ./internal/memory/providers/` → ok 1.094s; package build OK.
