HXC-048 — helixcode-system.yaml HelixQA bank (11 cases) covering non-auth server surface

Authored banks/helixcode-system.yaml (HXC-SYS-001..011): /health, /api/v1/server/info, /api/v1/system/status (401), /api/v1/llm/providers, + negatives (unknown path 404, wrong method). Uses only runner-consumed fields (action/body/headers/auth/expect_status/expect_json_path/expect_body_contains/_skip). Parse-validated: `helixqa list` → 11 cases; dry http run vs unreachable host fired real requests for 10 active cases + honored `_skip` on SYS-011. Confident body asserts from captured real responses (healthy/status, database/redis/go_version, source/ollama); status-only where exact message not captured (§11.4.6); SYS-011 `_skip` (404-vs-405 not pinned). `helix_qa` commit `f18a5d3b`. LIVE-RUN against booted server QUEUED (needs server-owning stream).

CLOSED — live runtime evidence (commit 4d2dcb2)

Rebuilt `helix_code/bin/helixcode` from CURRENT source (the on-disk binary was stale 12:16; rebuild 17:16). Booted no-infra (db=nil graceful, redis off) on :18090, /health 200. Live `helixqa http: - helixcode-system.yaml: 11/11 PASS` (SYS-011 pinned: non-GET on /health → real 404 “404 page not found”; Gin has no `HandleMethodNotAllowed` → un-skipped). - `helixcode-auth.yaml: 16/16 PASS`. Stale-artifact lesson (§11.4.108/§11.4.139): first auth run on the STALE pre-fix binary returned 500 (HXC-043 panic); after rebuild it returns 401 — re-confirms the HXC-043 fix on a clean artifact. Server SIGTERM clean, port freed.
