HXC-058 — helix_agent go build ./... third-party fixture (out-of-scope determination)

Captured: 2026-06-09T15:19:18Z · Bug · Fixed (→ Fixed.md) ## Investigation (§11.4.124 — third-party, do not modify) `cd submodules/helix_agent && go build ./...` fails on exactly ONE package: `cli_agents/continue/core/autocomplete/context/root-path-context/test/files/file1.go:4:2: package ... is not in std. cli_agents/continue` is a git submodule of `continuedev/continue` (.gitmodules line 154) — NOT owned (not vasic-digital/HelixDevelopment). `file1.go` is upstream's intentionally-non-compiling multi-language test fixture (siblings `file1.php`, `base_module.py`, etc.); `continue` has no `root.go.mod`. Per CLAUDE.md §3.2 `cli_agents/` holds third-party reference agents. Modifying it would violate §11.4.124 + §11.4.28. ## Resolution: owned build is GREEN — no owned-code defect `helix_agent`'s owned-build contract (Makefile): primary `go build -mod=mod ./cmd/helixagent + TEST_PACKAGES ./cmd/... ./internal/... ./pkg/... ./tests/... ./challenges/...` Captured: `- go build -mod=mod -o /tmp/helixagent_hxc058 ./cmd/helixagent → exit 0 - go build -mod=mod ./cmd/... ./internal/... ./pkg/... ./tests/... ./challenges/... → exit 0 (zero stderr)` The `./...` failure is solely the wildcard walking the on-disk third-party `continue` submodule; it is out of owned-build scope and NOT a defect in owned code. No code change made; no pointer bump.
