Phase 0 — Governance Baseline & Safety Net (Design / Spec)

Date: 2026-06-03 **Programme:** Own-org submodule sync → flatten → rebuild → test → fix (HelixCode CLI-Agent Fusion) **Status:** Approved (operator: 2026-06-03) — execution authorized, subagent-driven, autonomous loop.

Context

The operator requested a full programme: sync every own-org submodule to latest main/master + merge local work, flatten all `vasic-digital / HelixDevelopment` submodules to a flat `HelixCode/submodules/<snake_case>` layout, rewrite all references, run `install_upstreams` everywhere, clean git configs, rebuild everything via the `containers` submodule, boot infra, run all tests + Challenges in anti-bluff mode, and fix every issue found. The work is decomposed into sequenced phases; this spec covers **Phase 0** only.

Discovered state (read-only probe, 2026-06-03)

- `.gitmodules` declares **70 own-org submodules** (of 131 top-level); ~64 are nested under `dependencies/{vasic-digital, HelixDevelopment}/...`
- HelixConstitution submodule is **wired & checked out** at `d90ab87` on `main`, up to date with its tracking upstream; working tree clean.
- The anti-bluff mandate (“...most of the features does not work... MUST guarantee quality, completion, full usability...”) is **already present** in root `CONSTITUTION.md`, `CLAUDE.md`, `AGENTS.md`, `QWEN.md` **and** in the HelixConstitution submodule’s own files. No insertion required — verify only.
- Four submodules carry forbidden GitFlic/GitVerse push remotes: `constitution`, `submodules/models`, `submodules/models` (own-org), and `cli_agents/claude-code-source` (third-party, not pushed).
- Operator decision: **push to ALL upstreams including GitFlic + GitVerse**. This contradicts `CONST-038` as written → reconcile the rule (item 2).

Goal

A verified, self-consistent governance source-of-truth and a reversible safety baseline, established **before** any 70-repo mutation phase.

Scope — IN

1. **Governance verification (no insertion)**. Run `scripts/verify-governance-cascade.sh`; capture output as evidence under `docs/migration/`. Confirm the anti-bluff mandate is present across root + constitution submodule + owned submodules. If an owned submodule is missing it, add it there (and cascade per `CONST-047`).

2. **Reconcile CONST-038 to operator remote policy.** Edit HelixCode root CONSTITUTION.md, CLAUDE.md, AGENTS.md, QWEN.md, CRUSH.md so the CONST-038 / §6.W note permits GitHub + GitLab + GitFlic + GitVerse for the affected own-org repos, removing the doc-vs-practice contradiction. Keep all five peer governance docs in sync (root “keep in sync” rule).
3. **Safety backup (reversibility).** Generate a restore manifest capturing every submodule’s current commit SHA + full remote set, plus a snapshot of .gitmodules, under docs/migration/phase0-restore-manifest-2026-06-03.txt. Validate it round-trips (re-reading reproduces current SHAs).

Scope — OUT (later phases)

- Submodule sync-to-latest + merge (Phase 1)
- Flatten layout + rewrite references (Phase 2)
- Rebuild everything (Phase 3)
- Boot infra + run all tests/Challenges (Phase 4)
- Fix every issue, anti-bluff (Phase 5)

Execution

Subagent-driven (§11.4.70). Parallelizable read-only units (cascade audit, backup manifest) dispatched as concurrent subagents; the CONST-038 reconciliation edit + all git commit/push operations run serially in the conductor thread to preserve working-tree quiescence (§11.4.84). Pushes background-detached after commit (§11.4.88), to **all** upstreams per operator policy.

Done criteria (anti-bluff, evidence-backed)

verify-governance-cascade.sh output captured showing mandate present everywhere (path recorded).

CONST-038 reconciled across all 5 root governance docs; committed; pushed to all upstreams; cascade re-verified (no contradiction remains).

Restore manifest written + validated (round-trip check passes).

Main repo + any touched owned submodule committed & pushed to all upstreams.

Risk / rollback

- Phase 0 mutations are limited to documentation + a manifest file → low blast radius, reversible via git revert. The restore manifest itself is the rollback anchor for the higher-risk Phases 1–2.
