Stream FLAT-BUILD-SUBS — build-verify helix_agent + helix_qa (Bash ok; NO Edit — propose patches as text)

Repo: /Users/milosvasic/Projects/HelixCode. Two relocated Go submodules now at submodules/helix_agent/ and submodules/helix_qa/. - helix_agent/go.mod: 37 replaces rewritten ../dependencies/{org}/X → sibling ../X; plus ../dependencies/HelixDevelopment/llms_verifier/llm-verifier → ../llms_verifier/llm-verifier. - helix_qa/go.mod: dual capital/lowercase replace blocks normalized to ONE lowercase block; LLMsVerifier → llms_verifier; sibling ../X form.

Pasted terminal output is REQUIRED evidence — no verdict without actual output.

1. helix_agent:

1. cat submodules/helix_agent/go.mod — paste replace section; flag any line still containing dependencies/ or a capitalized leaf.
2. cd /Users/milosvasic/Projects/HelixCode/submodules/helix_agent && go build ./... 2>&1 | tail -120 && echo "---VET---" && go vet ./... 2>&1 | tail -60. PASS/FAIL + output.
3. Files .trivy.yaml and challenges/scripts/challenge_framework.sh had stale refs — quote lines; state decoupled-own-layout (leave per CONST-051) vs genuinely broken. Do NOT propose parent-layout rewrites for decoupled files.

1. helix_qa:

1. cat submodules/helix_qa/go.mod — paste replace section; confirm single lowercase block (no duplicate capital block), no LLMsVerifier, sibling ../X. Flag deviations.
2. cd /Users/milosvasic/Projects/HelixCode/submodules/helix_qa && go build ./... 2>&1 | tail -120 && echo "---VET---" && go vet ./... 2>&1 | tail -60. If go.work errors on workspace, note it + the modified go.work.sum state. PASS/FAIL + output.
3. File helix-deps.yaml: quote relevant lines; decoupled-vs-broken verdict.

Per submodule: verdict + minimal go.mod patch proposal if needed. Note: a fix here = a commit INSIDE that submodule repo (I apply serially).

Output: compact markdown.
