

Status_Summary

HelixCode Feature Status — Summary

Revision	1
Created	2026-06-15
Last modified	2026-06-15
Status	active (population round 1 complete)
Status detail	docs/features/Status.md

One-screen rollup of the full feature inventory in `docs/features/Status.md`. Kept in sync via `docs_chain` (§11.4.106). Anti-bluff: **video-confirmed = 0** until real analyzed recordings exist in `/Volumes/T7/Downloads/Recordings` (§11.4.83/§11.4.107).

Table of contents

- [Coverage by area](#)
- [Rollup by overall status](#)
- [Video-confirmation progress](#)
- [Honest coverage gaps](#)

Coverage by area

Round-1 inventory catalogued ~**388 discrete features** across the whole system:

Area	Source	Features	Notes
Internal services + infrastructure	<code>helix_code/internal/*</code> (72 pkgs)	233	domain code: llm, tools, auth, task, session, server, memory, ...
cmd tools + client apps	<code>cmd/*</code> (21) + <code>applications/*</code> + web	67	CLI (14 REPL cmds + 7 cobra), TUI (7), web (4 + ~18 API groups), desktop (6), mobile (8)
Owned-submodule capabilities	<code>submodules/*</code> (50 owned)	55	only 3 imported directly by HelixCode; ~10 by path; ~25 transitive-via- <code>helix_agent</code> ; ~25 not in build graph
		33	

Area	Source	Features	Notes
Ported cli_agents capabilities	cli_agents/* → HelixCode		20 landed, 3 partial, 10 planned-not-landed

Rollup by overall status

Overall	Meaning	Approx. count
confirmed	working + real analyzed video	0 (recordings not yet produced)
working-untaped	implemented + wired + unit-tested, no video yet	~290
partial	real but thin/unverified coverage or partial wiring	~190
gap	scaffold / untested / not-wired / planned-not-landed	~52

Video-confirmation progress

The video-QA program (real strong-LLM scenarios → /Volumes/T7/Downloads/Recordings, analyzed, problems fixed) is the path from working-untaped → confirmed. Verified foundation: **DeepSeek V3** (strongest) + Mistral Large + Groq Llama-3.3-70B ensemble, all real through the helix stack. Web LLM trio (/generate, /stream, /specify) already has real e2e evidence (docs/qa/web-llm-e2e-20260615/). Recordings-confirmed count rises only as real analyzed videos land — never bluffed.

Honest coverage gaps

- **Mobile apps are scaffolds** (no build.gradle/AndroidManifest.xml for Android, no Xcode project for iOS) — must be made buildable before any device/simulator recording. Android Genymotion emulator is live (adb); iOS-simulator launch mechanism (via the containers submodule, per operator) is a pending build task.
- **Deeper inventory recommended** for: helix_agent (1583 test files — only umbrella capabilities captured), security submodule (per-package capabilities not yet enumerated), helix_specifier, helix_qa, panoptic; and internal clientcore, agentbridge, checkpoint, ensembleui, substrate, workspace, voice, roocode, telemetry, verifier, worker, server.
- cmd/security_scan has zero tests (bluff-risk gap).
- ~60 HTTP CRUD/auth/workflow endpoints are tested at the manager layer, not HTTP-transport — honestly integ/none, not e2e.
