

# submodule\_integration\_plan

## Submodule Remote-Ahead Gitlink-Integration Plan

**Date:** 2026-06-24 · **Scope:** consolidated REMOTE-AHEAD gitlink bump for owned submodules whose upstream main is ahead of the recorded gitlink (challenges, helix\_qa, security). **Constitution:** advanced merge-onto-latest-main, NO force-push (§11.4.113); fetch+investigate before integrate (§11.4.71); reuse-not-reimplement (§11.4.74); evidence-not-bluff (§11.4.6). Conductor executes post-cycle. This doc is READ-ONLY planning — no HEAD/working-tree changed. **Constitution submodule:** covered separately in docs/qa/constitution\_advance\_investigation.md.

Method: per submodule `git fetch <remote> main (no checkout) + git log <recorded-gitlink>..  
<remote>/main + git show <remote>/main:<file> content compare. Recorded gitlinks from git submodule status.`

### Per-submodule summary

| Submodule  | Recorded gitlink | Remote main HEAD | Ahead | Safe to bump                        | go.mod impact                                                                                                                                                                                                 | Action                                                                   |
|------------|------------------|------------------|-------|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| challenges | 04e6c6ee         | 47691983         | 7     | YES (gitlink-only)                  | // indirect + replace ../submodules/challenges; NOT imported by helix_code source → <b>gitlink-only, no build-test needed</b>                                                                                 | Integrate still-need files onto advanced discard 2 redundan bump         |
| helix_qa   | 26f686a3         | d45bd3d          | 13    | YES, but <b>REQUIRES BUILD-TEST</b> | DIRECT require digital.vasic.helixqa + replace ../submodules/helix_qa; <b>imported by 3 helix_code prod files (5 pkgs: config/evidence/orchestrator/reporter/screenshot) → a bump IS a dependency upgrade</b> | Bump + helix_c go buil && go t interna helixqa interna server/ before co |

| Submodule | Recorded gitlink | Remote main HEAD | Ahead | Safe to bump       | go.mod impact                                                                                            | Action         |
|-----------|------------------|------------------|-------|--------------------|----------------------------------------------------------------------------------------------------------|----------------|
| security  | 08f3e10          | b69c7d9          | 5     | YES (gitlink-only) | replace ../submodules/security only, no require, NOT imported by helix_code source → <b>gitlink-only</b> | Plain git bump |

### challenges — what landed (7 commits, recorded→remote)

- 4769198 feat: control-plane Challenge coverage (helixd/etcd/nodes, D17)
- 08e1331 fix(D8): no\_suspend challenge reaches scanner + PASSes; allowlist HTML/PDF exports
- 1306ce3 test(anti-bluff): scanner-triage floor — body asserts + state-delta + skip annotations
- 03bdd3f test(anti-bluff): scanner-triage — real observable assertions + honored skip annotations
- d7f4656 chore(constitution): inherit Helix Constitution; submodules/ layout
- 402d176,69420b0 merge/constitution-layout
- **Beneficial:** new Challenge coverage + anti-bluff hardening. Bump is beneficial AND clears the redundant part of my uncommitted fix (see verdict below).

### helix\_qa — what landed (13 commits, recorded→remote)

- 74b9e76 fix(banks): helix-ota-ab requires\_env map→[]string schema match (§11.4.27)
- 0431935 D18: Dockerfile non-root USER hardening (DS-0002)
- 5c632ed fix(D7): **add SKIP-OK exempt markers to 9 legit t.Skip sites** (BLUFF-G-001)
- 8c15fbd anti-bluff capture-then-assert markers in orchestrator challenge
- 22822c9 docs(governance) genuine HelixQA manual rewrite
- 78398d8 fix(build): **repoint llmsverifier replace → ../llms\_verifier (relocated under submodules/)**
- 8f35209,fae0795 decouple foreign-project refs / findHelixPlayRoot→findProjectRoot
- b2836d5 fix(build): correct llmsverifier replace path (earlier)
- 6466146,44a1983,0f7c629 constitution-layout/merges
- **Beneficial:** build-wiring fixes (the relocation repoint), anti-bluff SKIP-OK markers, Docker hardening. **But build-graph-sensitive** — see risk note.

### security — what landed (5 commits, recorded→remote)

- b69c7d9 test(anti-bluff): scanner-triage — real observable assertions + honored skip annotations
- 1a15069 decouple: generalize residual foreign-project refs in comments/docs/scripts
- 04ccf93,5c73698,05c4527 constitution-layout/merges
- **Beneficial:** anti-bluff + decoupling. Low risk (not in helix\_code build graph).

## CHALLENGES REDUNDANCY VERDICT — PARTIAL

My uncommitted working-tree fix added 15 SKIP-OK markers across 5 files (still on the OLD recorded gitlink 04e6c6ee). Compared against the advanced remote main (47691983):

| File (my fix touched)                | remote-main SKIP-OK           | Upstream commit that did it | My fix verdict           |
|--------------------------------------|-------------------------------|-----------------------------|--------------------------|
| pkg/container/verifier_test.go       | 3 (all sites)                 | 03bdd3f                     | REDUNDANT — discard      |
| pkg/userflow/container_infra_test.go | 3 (all sites)                 | 1306ce3/<br>03bdd3f         | REDUNDANT — discard      |
| pkg/challenge/stress_test.go         | 0 (bare t.Skip short-mode ×3) | —                           | STILL NEEDED — integrate |
| tests/chaos/chaos_test.go            | 0 (bare t.Skip short-mode ×5) | —                           | STILL NEEDED — integrate |
| tests/stress/stress_test.go          | 0 (bare t.Skip short-mode ×3) | —                           | STILL NEEDED — integrate |

**Conclusion:** the challenges upstream-ahead (03bdd3f/1306ce3 scanner-triage commits) already added SKIP-OK to the **2 container/scanner files** → those edits are redundant and MUST be discarded (re-applying = merge noise / conflict on identical sites). The **3 short-mode stress/chaos files** were NOT addressed upstream (0 SKIP-OK, bare t.Skip) → my fix for those 11 markers must be re-applied ON TOP of the advanced main 47691983, not the stale base.

## BUILD-GRAPH RISK NOTE (helix\_qa only)

helix\_qa remote-main go.mod has replace digital.vasic.llmsverifier => ../llms\_verifier, resolving from submodules/helix\_qa/ to submodules/llms\_verifier/ (exists). BUT that module declares module llmsverifier, not digital.vasic.llmsverifier — a potential module-path mismatch. Commit 78398d8 explicitly repointed this, so it is the intended post-relocation state, but it is UNVERIFIED at the helix\_code build level. This is exactly why a helix\_qa bump needs a real go build/go test (§11.4.6 — verify, don't assume), not a blind gitlink update. challenges + security carry no such build-graph dependency.

# ORDERED CONDUCTOR INTEGRATION PLAN

Run from repo root, post-cycle, on a quiet host. Per §11.4.113 merge-onto-latest-main, NO force-push.

1. **security (lowest risk, gitlink-only):** `git -C submodules/security fetch origin main → git -C submodules/security checkout b69c7d9 → stage gitlink in meta-repo. No build-test. Commit gitlink bump.`
2. **challenges (gitlink-only + partial-fix integration):**
  1. `git -C submodules/challenges fetch origin main.`
  2. **Discard the 2 redundant files** (restore to remote-main versions): `git -C submodules/challenges checkout origin/main -- pkg/container/verifier_test.go pkg/userflow/container_infra_test.go.`
  3. **Carry the 3 still-needed files** onto advanced main: stash/re-apply the 11 short-mode SKIP-OK markers (`pkg/challenge/stress_test.go ×3`, `tests/chaos/chaos_test.go ×5`, `tests/stress/stress_test.go ×3`) on top of 47691983 (merge-onto-latest-main; trivial — they touch only bare t. Skip lines that are unchanged upstream).
  4. Commit on a challenges branch off 47691983, push to all upstreams (NO force).
  5. Stage the new challenges gitlink in meta-repo. (Indirect dep, not imported — no build-test.)
3. **helix\_qa (LAST — build-test gated):**
  1. `git -C submodules/helix_qa fetch origin main → checkout d45bd3d.`
  2. **MANDATORY build-test** (it IS a dependency upgrade): `cd helix_code && go build ./... && go test ./internal/helixqa/... ./internal/server/... — confirm the llmsverifier replace-path / module-name resolves. If it fails, STOP and investigate the module-path mismatch before bumping (do not commit a broken build graph).`
  3. On green, stage the helix\_qa gitlink in meta-repo.
4. **Meta-repo commit:** one commit bumping all 3 gitlinks (+ challenges fix carry-over reflected in the challenges branch), update docs/CONTINUATION.md (§13.1), push to all upstreams (NO force).

**Leave untouched until conductor runs:** all submodule HEADs (detached, normal) and the challenges working-tree edits (the 5 modified files) — they remain as-is; this plan only records the discard/carry decision for the conductor.
