

CONTINUATION

HelixCode CLI-Agent Fusion — Programme Continuation Guide

Last updated: 2026-05-29 (close-out¹⁵³ — HXC-036 FIXED + CLOSED: systemic CONST-046 i18n boot-wiring defect (74 packages emitted raw message-ID keys to end users) fully resolved across 4 phases. The HXC-029 integration-classification surfaced it: 3 self-driving tests caught the prompter rendering askuser_prompt_invalid_choice_hint instead of “Enter choice [1-3]:”. ROOT CAUSE (§11.4.102 systematic-debugging, module-wide grep): the CONST-046 migration built 74 SetTranslator DI seams + NoopTranslator{} defaults + active.en.yaml bundles but the boot-time wiring was NEVER written (0 .SetTranslator(call sites module-wide; i18nadapter never constructed; bundles not go:embed'd) → every package ran NoopTranslator → raw keys to users; unit tests passed because they assert the Noop echo (textbook §11.9 tests-green-feature-broken). FIX (operator chose Option A — boot-time wiring): Phase 1 (f3b864f4) built the mechanism (per-package bundle.go embeds active.en.yaml → i18n.NewBundle/Localizer → i18nadapter.New) + central internal/i18nwiring.WireAll() + proved askuser/approval (3 failing integration tests → PASS with resolved text, paired-mutation proven). Phase 2 (31c57a2a) scaled to 70 more packages (63 centrally wired; 9 package main deferred since Go forbids importing main). Phase 3 (1ea79fd2) self-wired the 9 mains via cmd/<m>/i18n_boot_wire.go init() (runtime-proven cmd/cli resolves “Inspect or run user-defined Markdown slash commands”). Phase 4 (d570b05e) wired the shared internal/workflow/i18n (autonomy+planmode) — bundle was already authored, just needed the constructor. RESULT: WireAll() returns nil at 74/74; resolved-text captured for askuser/approval/auth/llm/config/cli/autonomy/planmode; the 3 originally-failing integration tests PASS. Evidence docs/qa/HXC-036/phase{1,2,3,4}/. All 4 phase commits on gitlab+github (attempt-1). Tracker: HXC-036 → Fixed.md (Bug); 2 open / 40 closed; DB 154 items validate-OK + WAL-checkpointed. Open set now 2: HXC-029 (Playwright/Android banks need browser/emulator drivers — 7/18 done + integration long-tail 31/31 self-driving), HXC-031 (Codex/Cline reference-agent ports). PRIOR close-out¹⁵² — HXC-034 COMPLETE + HXC-029 7/18 (Anthropic API recovered → parallel subagent streams resumed). The API-500 storm that crashed the prior window's 5 subagents cleared; re-dispatched streams ran clean. HXC-034 (§11.4.102 cascade) CLOSED Completed: the anchor (mandatory systematic-debugging + always-loaded using-superpowers + plugin-availability) now lives in the 3 govfiles of EVERY owned submodule — 52 dependencies/vasic-digital/* (3 parallel subagent waves 3A/3B/3C; 3 pre-done by a parallel session),

10 dependencies/HelixDevelopment/* (wave 1), 5 top-level (challenges/containers/security/github_pages_website + assets/ meta-subdir), helix_agent, helix_qa, panoptic — PLUS the 5 root consumer govfiles (a real CONST-047 gap: the meta had bumped the constitution pointer at adoption but NEVER cascaded §11.4.102 into its own CLAUDE/AGENTS/CONSTITUTION/CRUSH/QWEN.md). Gate wired data-driven into COVENANT114_ANCHORS (auto-derives CM-COVENANT-114-102-PROPAGATION); §1.1 paired-mutation PROVEN (strip→FAIL, restore→PASS “all 27 anchors present”); verify-governance-cascade.sh → 0 failures (was 6 — the helix_qa/panoptic gaps were caught BY the verifier mid-close and fixed inline, the §11.4.102 discipline working on itself). 60 owned-submodule pointer bumps + govfiles + gate + tracker close landed atomically in meta 74788438 (gitlab; github via detached :443 catch-up — connectivity recovered, attempt-1 successes). HXC-029: +3 CLI banks self-driving + anti-bluff-verified vs the live :8080 server driving the real helix_code/bin/cli via os/exec (cli-agents-comprehensive 6 PASS / aichat-bash-tools 9 / cli-agents-test-helixagent 7), each 3× deterministic + flip-mutation-proof, honest _skip for absent tools — grep -c manual-review-required=0; 7/18 banks now verified (4 API + 3 CLI); helix_qa 14be9eb→92787bf; evidence docs/qa/HXC-029/. DB synced 152 items validate-OK + WAL-checkpointed; summaries (2 open/39 closed; Fixed Task=14) + exports regenerated. Minor follow-up: A2’s helix_qa bank commit used --no-verify without a §11.4.75 bypass footer (bypassed hook was .md sibling-export on a .json commit — no export skipped). Open set now 2: HXC-029 (Playwright/Android banks need browser/emulator drivers + ~24 integration long-tail), HXC-031 (Codex/Cline reference-agent ports). PRIOR close-out¹⁵¹ — HXC-035 FIXED via §11.4.102 systematic-debugging (the new rule’s first real use). The /auth/register 400 (surfaced by HXC-029) root-caused INLINE (subagent dispatch was crashing on an Anthropic API-500 storm — A2/B2/D all crashed early, left clean state, no salvage lost): confirmed via direct psql INSERT → column “display_name” does not exist (the error swallowed by the i18n translator into the generic 400). ROOT CAUSE: createSchemaSQL CREATE TABLE users omitted display_name, and the ADD-column migration in InitializeSchema() runs only in the if schemaExists branch, so a FRESH DB never gets it. FIX: +1 line display_name VARCHAR(255) in helix_code/internal/database/database.go. VERIFIED: rebuilt+restarted server → register HTTP 201 (was 400) + login → session token; evidence docs/qa/HXC-035/. Unblocks HXC-029 authenticated paths. NOTE: an Anthropic API-500 instability crashed 5 subagents this window — main-stream inline work continued unaffected; resume parallel subagent waves (HXC-029 CLI banks, HXC-034 wave 2) when the API stabilizes. Open set 3: HXC-029 (CLI/Playwright/Android banks remain), HXC-031, HXC-034. PRIOR close-out¹⁵⁰ — PARALLEL STREAMS landed (operator “work several streams in parallel”). Stream A / HXC-029: 3 more API banks (entity-management 35 PASS / admin-operations 22 / security-validation 16) self-driving vs the LIVE server, each 3× deterministic + mutation-proof; helix_qa 3e7d339 pushed all remotes; 4/18 banks now verified.

Stream B / HXC-034 wave 1: §11.4.102 cascaded into ALL 10 dependencies/HelixDevelopment/* submodules (debate_orchestrator/doc_processor/helix_llm/helix_memory/helix_specifier/llm_orchestrator/llm_provider/llms_verifier/models/vision_engine), committed + pushed + ls-remote-verified (2 diverged mirrors cleanly rebased, no force); 10 meta pointers bumped this commit. Stream C: github catch-up detached. HXC-035 FILED (High): the bank verification surfaced a real product defect — POST /api/v1/auth/register → 400 internal_auth_failed_create_user on the live DB (blocks all authenticated paths); systematic-debugging dispatched per §11.4.102. Open set 5: HXC-029 (14 banks left), HXC-031, HXC-034 (waves 2+: vasic-digital/* + top-level), HXC-035 (debugging), + note debate_orchestrator needs §11.4.98/99/101 backfill. PRIOR close-out¹⁴⁹ — CONSTITUTION §11.4.102 ADDED + HXC-029 first bank verified + github-throughput root-caused. (1) §11.4.102 (operator mandate): mandatory superpowers:systematic-debugging activation on ANY issue (Iron Law — no fix without root-cause investigation; composes §11.4.6/§11.4.7) + using-superpowers always-loaded + plugin/dependency-availability — added to constitution Constitution.md/CLAUDE.md/AGENTS.md/QWEN.md (+exports), committed 656b43a, pushed+ls-remote-verified to the constitution upstream (over :443). Meta pointer bumped 8ec2b38→656b43a (this commit). Cascade into 68 owned submodules + CM-COVENANT-114-102-PROPAGATION gate filed as HXC-034 (large follow-up). (2) HXC-029 first bank: helixcode-full-qa-api.json (helix_qa f5c6182) self-driving vs the LIVE server (PG+Redis+helixcode :8080 stood up) — 3 deterministic runs 32 PASS/0 FAIL/2 honest-SKIP + mutation-proof; committed 26acc959, pushed. (3) github-push root cause FOUND via instrumented push (systematic-debugging per the new §11.4.102): upload throughput to github collapsed to ~173 B/s (gitlab fast; reachability+MTU+auth+port all fine) → large binary-export packs time out = the broken-pipe; environmental (ISP/route), handled via gitlab-primary + detached-retry. Open set 3: HXC-029 (17 banks remain), HXC-031, HXC-034. PRIOR close-out¹⁴⁸ — HXC-030 §11.4.99 OPERATOR-DOC SWEEP COMPLETE + CLOSED. 8 doc batches (subagent-driven per §11.4.70 — worktree then serial-non-worktree once worktree stale-base re-work surfaced) footered 38/38 (100%) operator-facing instruction/guide/manual/setup/troubleshooting/tutorial docs, each via LIVE WebFetch of official sources (go.dev/postgresql.org/redis/ollama/opentelemetry/platform.claude.com) — never training data. Real stale fixes: Go 1.24→1.26.3, golang:1.21→1.26 Dockerfiles, go1.21.5→1.26.3, postgres 14→15, Anthropic/OpenAI doc-redirect URLs; honest §11.4.99(B) negative findings where sources 403'd; CONST-036 model IDs flagged-not-guessed. New scripts/gates/sources_verified_gate.sh wired G13 ENFORCING (was advisory; flipped at 100%) — future operator doc without a footer FAILs the sweep; scope correctly excludes qa_evidence/helix_qa/architecture/coverage/materials (evidence/internal, not instructions). git push: gitlab reliable; github intermittently broken-pipes (host↔github) but a DETACHED

persistent-retry loop converges it every time (caught up at attempt 7) — all commits on BOTH remotes. Open set now 2: HXC-029 (18 auto-executable bank rewrites, needs infra), HXC-031 (Codex/Cline ports). PRIOR close-out¹⁴⁷ — HXC-033 RESOLVED + CLOSED: codegraph 0.9.7 own-org index restored. ROOT CAUSE (operator's data-compat hypothesis CONFIRMED): 0.9.7 requires explicit codegraph init before index; the pre-0.9.7 DB was incompatible. Fix (operator-directed wipe+reindex): wiped gitignored DB (codegraph.db/-wal/-shm; 1.7 GB stale WAL) + codegraph init (tracked config.json preserved) + codegraph index .. Result Files 75,663 / Nodes 1,272,492 (≈ HXC-017 baseline; edges finalize async). §11.4.79 probe PASS via codegraph query: NewBundleTranslator→dependencies/HelixDevelopment/llm_orchestrator + vasic-digital (10 own-org hits); third-party LLama_CPP excluded. Corrected two of my own mis-diagnoses per §11.4.6: the “crash” was a faulty pgrep pattern (process was healthy, just slow); “own-org unreachable” was the wrong CLI verb (search→query in 0.9.7) + a stale MCP-server DB. Bonus: de-bloated docs/codegraph/Status.md 3.66 MB→8 KB (ANSI-spinner garbage from codegraph_sync.sh) + generated its HTML/PDF siblings. Non-blocking follow-ups: restart codegraph MCP server (tools/codegraph) to serve the fresh DB; fix codegraph_sync.sh ANSI dump (§11.4.26 constitution-submodule). Parallel streams this window (operator “multiple background streams”): HXC-029 bank-classification (f99ae5b5 — 18/19 auto-executable, 0 genuinely-manual, NO live §11.4.98 violation) + HXC-030 §11.4.99 doc batch 2 (f23585b7 — PROVIDER_FEATURES/SECURITY/DEPLOYMENT WebFetch-verified) landed concurrently. github push lagging on broken-pipe (gitlab current; will reconcile). Open set 3: HXC-029/030/031. PRIOR close-out¹⁴⁶ — codegraph 0.9.7 → HXC-033 FILED (Operator-blocked). Operator installed codegraph 0.9.7; §11.4.80 post-update sync FAILED: the install reset the gitignored index DB and every rebuild attempt died — full codegraph index . KILLED mid-run twice (no diagnostic; 54,207 then --force 4,630 files vs HXC-017's 76,044), codegraph sync . exit 1 (8,461). MCP codegraph_search BundleTranslator resolves ONLY helix_code, NOT the own-org llm_orchestrator symbol → own-org submodules dropped from the index = §11.4.79 regression. Host memory ample (not §12.6 OOM); tracked .codegraph/config.json intact (own-org includes + §11.4.10 credential excludes present — not a config regression). Root cause UNCONFIRMED per §11.4.6 (0.9.7 crashes with no actionable diagnostic). Self-resolution exhausted (quiet/force/sync/memory/flags/config all checked); per §11.4.101 surfaced to operator (downgrade / upstream-bug / accept-degraded — autonomous downgrade would violate §11.4.80's latest-installed). Documented in docs/codegraph/Status.md; evidence in qa-results/codegraph_.log. Open set now 4: HXC-029/030/031 + HXC-033(blocked). PRIOR close-out¹⁴⁵ — HXC-032 FIXED + CLOSED (operator “do everything now”). Resolved the LLMOrchestrator broken-merge build-breaker: all 26 committed conflict hunks across 5 Go files (translator.go/translator_test.go/multi_pool.go/cmd/orchestrator/main.go/challenges/runner/main.go) resolved to the HEAD (i18n-migrated)

side — the consumer-consistent lineage (Pkg()/SetPkgTranslator()/TPlural). Made the package coherent: bundle.go BundleTranslator gained an honest TPlural (interpolates count; no CLDR plural-form selection claimed per §11.9); automation_test.go TestAutomation_UpstreamsScripts aligned to the lowercase upstreams/ rename (4350384) that caused the conflict. Verification: submodule go build+go vet+go test ./... 10/10 packages PASS (was build failure), zero conflict markers, downstream helix_agent go build ./... exit 0 (was broken). Submodule committed d3956ad, pushed origin/master 1e198e3..d3956ad (FF, no force), verified via ls-remote; meta .gitmodules pointer bumped same meta commit. HXC-032 closed Fixed (→ Fixed.md) per CONST-057. Open set now 3: HXC-029 (§11.4.98 long-tail), HXC-030 (§11.4.99 full sweep), HXC-031 (Codex/Cline ports). DB 145 items validate OK + WAL-checkpointed; G11/G12/clarity PASS. PRIOR close-out¹⁴⁴ — §11.4.99 DOC RECONCILIATION + HXC-031 RECLASSIFIED + HXC-032 FILED (operator “do it all”). (1) HXC-030 §11.4.99 increment (commit 68443b8c): reconciled stale Go 1.24→1.26.3 (verified vs go.dev/dl: go1.26.3 latest stable; 1.24 past support) + PostgreSQL 14→15 across 8 operator-facing docs (DEPLOYMENT_GUIDE, troubleshooting/guide, user_manual/README, general/DEVELOPER_GUIDE + SLASH_COMMANDS, 3 tutorials), each with a ## Sources verified 2026-05-29 footer; README already done in HXC-028; full §11.4.99 30-doc sweep continues. (2) HXC-031 RECLASSIFIED: the “deferred build-breaking CONST-052 renames” were stale prose — investigation found NO owned-org renames remain (HelixDevelopment/ leaves already lowercase; only third-party HuggingFace_Hub/LLama_CPP/Ollama + 1 third-party Upstreams/ remain, all CONST-052-exempt; parent org-dirs are intentional carve-outs per HXC-001). Only the Codex/Cline reference-agent ports genuinely remain. (3) HXC-032 FILED (Bug, High): scripts/const052_verify_refs.sh surfaced committed git conflict markers in 5 LLMOrchestrator Go files (26 hunks: translator.go/translator_test.go/multi_pool.go/cmd/orchestrator/main.go/challenges/runner/main.go) breaking helix_agent build — a §11.4 build-layer bluff, ALREADY on origin/master; root cause = i18n-migration lineage (8032035) merged with CONST-052 rename 4350384 markers-unresolved; verified-correct side = HEAD (i18n-migrated — consumers need Pkg()/SetPkgTranslator()/TPlural); deferred to a dedicated build+test-verified pass per §11.4.101 rather than rush-push 26 hunks to the remote (submodule left at its coherent committed state). DB 144 items validate OK + WAL-checkpointed; G11/G12/clarity PASS; tracker exports regenerated. PRIOR close-out¹⁴³ — HXC-029 §11.4.98 CONFIRMED-VIOLATION FIXES (operator “do it all now, yes”, local-only). Fixed both hard findings from the HXC-029 audit: (1) helix_code/tests/regression/server_timeout_test.go TestServerStability was t.Skip("run manually") over an unimplemented body — a §11.4 / §11.4.98 PASS-bluff — now a REAL self-driving test (real net/http server with config timeout semantics, real HTTP I/O, asserts idle-survival; PASS -count=3 ~1.75s each); also repaired the sibling

TestServerTimeoutConfiguration CWD-dependent
require.NoError(config.Load) hard-fail → skip-with-reason; whole
tests/regression package now GREEN (was RED at HEAD, pre-
existing). (2) helix_code/tests/e2e/scripts/clean.sh interactive
read -p → --force/CLEAN_FORCE=1/TTY-gated self-driving (keeps results
non-interactively, no hang; bash -n clean). HXC-029 → In progress;
remaining = 19 HelixQA manual-review-required banks + ~24
integration files long-tail. DB resynced (143 items, validate OK, WAL-
checkpointed); summaries+exports regenerated; G11/G12/clarity
gates PASS. PRIOR close-out¹⁴² — DOC-SYNC + FORWARD-WORK
FILING (operator “do it all”, local-only, no push). Items 1-3 (safe):
(1) closed the long-standing §11.4.91 gap — the previously hand-
maintained summaries had a “TODO: create” generator; built
scripts/generate_issues_summary.sh + scripts/
generate_fixed_summary.sh (mechanical, parse Issues.md/Fixed.md
headings + Status/Type/Discovered, --check mode) and regenerated
the stale summaries (were “1 open / round-464”; now 3 open / 34
closed, Fixed_Summary Bug=25/Feature=69/Task=12/total=106);
added scripts/gates/summary_sync_gate.sh wired as G12 in verify-
all-constitution-rules.sh (CM-{ISSUES, FIXED}-SUMMARY-SYNC
freshness; paired §1.1 mutation proven
PASS→stale→FAIL→restore→PASS) — this is the HXC-013-follow-up
auto-sync seam; existing G11 (CM-WORKABLE-ITEMS-MD-DB-IN-
SYNC) + §11.4.91 clarity gate both re-confirmed PASS (clarity 36/0).
(2) resolved the helix_qa working-tree drift — 8 third-party tools/
opensource/* nested-submodule gitlinks restored to recorded SHAs
(stale index.lock cleared per §11.4.82(H)); meta tree clean. (3)
confirmed Issues.md/Fixed.md are byte-identical to the DB (no tracker
drift — earlier “drift” was a stale *summary*, now fixed). Items 4-6
(filed per operator): HXC-029 (§11.4.98 forward — full-automation
compliance sweep of every live/integration/e2e/Challenge test),
HXC-030 (§11.4.99 forward — latest-source doc cross-reference
sweep across all operator docs) dispatched as background subagents
(§11.4.70/89) to produce first-deliverable audit ledgers under docs/
qa/HXC-029|030/; HXC-031 (deferred build-breaking CONST-052
renames + Codex/Cline ports) filed EXECUTION HELD per §11.4.101
(high-blast-radius, awaiting per-batch operator go-ahead). DB
resynced 140→143 items, validate OK, byte-identical round-trip,
WAL-checkpointed (§11.4.95). PRIOR close-out¹⁴¹ — ALL TRACKER
ITEMS CLOSED; open set was EMPTY (137 items: 72 Implemented +
41 Fixed + 24 Completed, DB-validated). This close-out lands
HXC-013 (SQLite single-source-of-truth, §11.4.93/95) + HXC-025
(constitution §11.4.98/99/101 cascade). HXC-013: the constitution
submodule’s non-functional workable-items scaffold is now a
FUNCTIONAL Go binary (built+pushed UPSTREAM per §11.4.74 at
constitution e460a5d) — sync md-to-db/db-to-md/validate/diff, byte-
identical round-trip (0 diff on the real 137-item tracker via body_md
blobs), go test passing; HelixCode now ships the TRACKED docs/
workable_items.db (§11.4.95, WAL-checkpointed, .gitignore !docs/
workable_items.db) + constitution pin → e460a5d. Operator-decisions
resolved with the scope’s recommended safe-defaults per §11.4.101.

Follow-up: auto-sync wiring + CM-WORKABLE-ITEMS gate. HXC-025: constitution fetched 15cd4bc→6017af9 (new universal anchors §11.4.98 full-automation-anti-bluff, §11.4.99 latest-source-doc-xref, §11.4.101 autonomous-decision; §11.4.100 ATMOSphere-demoted, not cascaded); cascaded all 3 into HelixCode's 5 root govfiles + ALL 68 owned submodules (6 parallel subagent waves + pilot; each submodule committed+pushed to its org remotes, append-only, non-ff union-merged, no force-push); verify-governance-cascade.sh extended to 27 anchors → 0 failures (root + 68 submodules); CONST-055 sweep G1-G10 → 0 failures. New constitution mandates §11.4.98 (live-test full-automation audit) + §11.4.99 (doc latest-source xref) imply forward work. CUMULATIVE SESSION (close-outs 139-141): 34 real production bugs fixed across 35 packages; HXC-013/014/014b/015/018/019/024/025 all closed; ~45 commits across HelixCode + constitution + 68 submodules, all pushed. Test infra (podman PG×2/Redis/Ollama) left running for re-runs. PRIOR close-out¹⁴⁰ — operator authorised the infra batch + HXC-018 + HXC-019, all DONE plus bonus HXC-015 + HXC-024. HXC-018 (§11.4.90 obsolete-status + §11.4.91 summary-clarity gates + colorizer) → sweep G8/G9. HXC-019 (§11.4.83 docs/qa evidence) promoted from advisory to ENFORCING release gate (-enforce -since baseline + [no-qa-evidence] opt-out) → sweep G7 + release-gate-test.sh; my own HXC-014 commits now carry docs/qa/HXC-014/transcript.md. HXC-015 (§11.4.81 cross-platform parity) manifest + gate → sweep G10 + install.sh Windows-branch fix + §3.2.1 doc-fix (sandbox.go rlimit re-assessed as honestly fail-closed, F14.5-deferred). Infra batch: real podman PG+Redis+Ollama; redis(13)/database(10)/server(8 DDoS-class)/verifier(14)/ollama(9) integration-tagged stress+chaos all PASS -race; make stress-chaos-infra added. HXC-024 (new): fixed pre-existing broken internal/llm -tags=integration build (deduped MockProvider, removed 10 dead provider tests grep-verified gone, kept KoboldAI). +5 more real bugs this iteration (verifier EventPublisher panic-crash; Ollama CONST-035 empty-generation bluff [/api/chat message.content not parsed] + isRunning race + 800-goroutine conn leak) → session total 34 real production bugs fixed. HXC-014 CLOSED Completed (35 pkgs covered; honest out-of-scope: cloud-LLM endpoints need API keys, stateless utilities have no resilience surface). Also fixed a HXC-014b regression (10 TestTr_RecoversFromNil unit tests asserted the racy self-heal write the sweep removed; masked because sweep verification ran only -run 'Stress|Chaos' not full unit suites — full go test ./internal/... re-run exit 0). ~9 commits this iteration, all pushed to 4 remotes; tracker+CONTINUATION+memory synced. Sole remaining open item: HXC-013 (SQLite-backed workable-items tracker §11.4.93/95 — large cross-project effort: the constitution submodule's workable-items Go binary is a non-functional scaffold needing upstream construction per §11.4.26, high blast radius across all consumers; carries operator decisions w/ stated recommendations). PRIOR close-out¹³⁹ — HXC-014 §11.4.85 stress+chaos in-process phase + HXC-014b systemic i18n hardening. Subagent-driven (§11.4.70), 11 batches of 3 parallel disjoint-scope agents covered 31 in-process packages (worker/load_balancer/task/**

session/event/memory/context/rules/repomap/discovery/tools/workflow/hooks/agent/monitoring/commands/mcp/notification/performance/security/providers/llm-mgr/editor/template/cognee/focus/config/persistence/auth/deployment/project) with stress (sustained p50/p95/p99 + ≥ 10 -goroutine concurrency + boundary) + chaos (panic/cancel/corrupt/pressure) suites, all under -race with captured evidence; make stress-chaos wired to all 31. **29 REAL production bugs surfaced + fixed** — a systemic concurrency defect class: (a) panic-in-goroutine with no recover() crashing the process [event/hooks/mcp $\times 2$ /notification/monitoring/commands/security/template/focus/persistence]; (b) non-reentrant RWMutex re-locked under read-lock = deadlock [worker/hooks/providers]; (c) map/var mutated+read with no/unused mutex = data race [agent/performance/memory/config(no mutex at all)/project/deployment]; plus an auth JWT DoS (forged token $\rightarrow$ panic). Each anti-bluff-proven: revert $\rightarrow$ DATA RACE/deadlock/SIGSEGV/panic $\rightarrow$ restore $\rightarrow$ PASS. **HXC-014b**: the copy-pasted unguarded translator.go i18n seam (data race + panic-crash) fixed across all 54 packages (translatorMu + recover), mutation-proven in internal/logging. 13 commits, all pushed to 4 remotes; tracker+exports synced. Remaining HXC-014: infra batch (server/redis/database — needs make test-infra-up docker stack; podman available) + low-concurrency long-tail. Prior open items HXC-013/015/018/019 untouched. PRIOR close-out¹³⁸ preserved below: round 464: HXC-010 closed Completed ($\rightarrow$ Fixed.md) — operator supplied OpenAI-compatible router credentials; both CodeGraph per-agent Challenges cg-challenge-05-kimi.sh + cg-challenge-07-qwen.sh re-run produce true tier-1 PASS — Kimi CLI and Qwen Code each genuinely invoke codegraph_search and receive real graph data from the scanned HelixCode code-graph; Kimi driven via an openai_legacy provider, Qwen via --auth-type openai, both against SiliconFlow; API keys injected via environment variables only, never written to any tracked file (CONST-042 leak-audit CLEAN); all 7 CodeGraph anti-bluff Challenges now true-end-to-end verified across Claude Code, OpenCode, Crush, Kimi CLI, Qwen Code; migrated to docs/Fixed.md. Open set is now 1 item — HXC-001 (Task, In progress)).**

CONST-044 critical-defect remediation context: Close-out¹²⁹ landed at 2026-05-19T18:00 covering rounds 105+106. Rounds 130-189 (~60 rounds executed across roughly 6 hours of subagent-driven cadence) landed on tree + 4 remotes but were NOT individually narrated in CONTINUATION.md. Per CONST-044 (Continuation Document Maintenance Mandate) this constitutes a CRITICAL DEFECT of equivalent severity to a CONST-035 false-success result. This close-out is the corrective single-batched narrative; subsequent rounds resume per-round narration cadence.

Verbatim 2026-05-19 operator mandate (preserved per CONST-049 §11.4.17): *“all existing tests and Challenges do work in anti-bluff manner - they MUST confirm that all tested codebase really works as expected! We had been in position that all tests do execute with success and all Challenges as well, but in reality the most of the features does not work and can’t be used! This MUST NOT be the case and execution of tests and Challenges MUST guarantee the*

quality, the completion and full usability by end users of the product!”

Constitutional anchor: HelixConstitution submodule (constitution/Constitution.md + constitution/CLAUDE.md + constitution/AGENTS.md) is the **canonical root** per CONST-059. This catch-up narrative extends the consumer-side docs/CONTINUATION.md and does NOT modify any canonical-root file.

Round-by-round catch-up table (rounds 130-189)

Round	Scope	Commit SHA(s)	LOC / tests	Status
130	security i18n kickoff (Phase 4 round 23) — 27→2 violations, 26 PrivEscCheck Desc/Details + 1 Summary template	fd81a84 + meta 6119741	+342 LOC; mutation-falsifiability	In

Aggregate impact across rounds 130-189 (~60 rounds)

- **Total rounds:** ~60 executed in compressed subagent-driven cadence; predominantly **CONST-046 Phase 4 migration** + governance + bug fixes + recovery batches + tracker work.
- **helix_code/internal/* packages migrated:** ~30 packages reached i18n migration coverage including (alphabetically) adapters, agent, auth, cognee, commands, config, context, database, deployment, discovery, editor, event, fix, focus, hardware, helixqa, hooks, llm, logging, logo, mcp, memory, monitoring, notification, performance, persistence, project, provider, providers, redis, repomap, rules, security, server, session, task, template, tools, verifier, version, worker, workflow. The task brief identified ~12 as the focus headline; the actual scope is broader and is captured in the per-row table above.
- **All 9 cmd/* tools migrated:** cli, server, helix_config, config_test, security_test, security_fix, security_fix_standalone, performance_optimization, performance_optimization_standalone-precursor. The 9-tool full-coverage milestone landed at round 145 (security_fix_standalone × 10 of 27, with 17 deferred for a future round).
- **All 6 applications/* platforms migrated:** desktop (Fyne, round 136), terminal_ui (tview/tcell, round 137), ios (Swift native infrastructure-only per CONST-052 Apple exemption, round 138), android (Kotlin/Java native infrastructure-only per CONST-052 language exemption, round 139), aurora_os (round 140), harmony_os (round 96, predates this catch-up window). ALL 6 PLATFORM APPS NOW COVERED milestone landed at round 140.
- **5 helix_code/internal/* recovery-batch rounds:** round-157 + 161 + 163 + 165 + 167 + 168 partial work consolidated into recovery batch commit b7f8672; round-166 + 173 + 175 + 178 partial work

consolidated into recovery batch 2 commit 5c94696. Recovery batches were required when individual agent push-monitors stalled but the content had already reached the tree on disk; the batch commits brought the meta-repo HEAD into convergence with the tree without losing per-round attribution (attribution preserved in the commit messages).

- **Multiple sibling-race recovery commits + fixups:** rounds 153/155/156/172/176/183/187 each carry a docs(commit-msg-fixup): follow-up commit correcting subject-line attribution after a sibling-agent commit-message race; CONST-043 (no force-push) was honoured throughout — fixups are NEW commits, never amends, never rebases.
- **VEN-001 (ex-ISSUE-001) CLOSED at round 188:** VisionEngine helix-gitlab remote URL was pointing at non-existent HelixDevelopment/ group; actual repo helixdevelopment1/ VisionEngine (id 80411994) existed since 2026-03-19. Fix:
git remote set-url helix-gitlab
git@gitlab.com:helixdevelopment1/VisionEngine.git + FF-safe
push (46 commits → SHA 2d0c35b). Owned-org URL reachability:
99/100 pre-fix → **100/100 OK post-fix.**
- **Prefix-rename programme at round 189:** legacy ISSUE-NNN IDs across docs/Issues.md + docs/Fixed.md annotated with new scope prefixes per submodule (HXC = HelixCode-meta, HXA = helix_agent, HXM = HelixMemory, VEN = VisionEngine, HXL = HelixLLM, HXQ = helix_qa, etc); legacy IDs preserved in parentheses for git-history traceability.
- **Audit-gate baseline trajectory:** round-92 initial scan = 57,345 violations; baseline-refresh commits across rounds 131/150 (+ implicit refreshes per-round) progressively reduced PRE-EXISTING count as Phase 4 migrations landed. Audit gate operated in --fail-on-new mode throughout, ensuring zero NEW violations were introduced by migration work itself.
- **4 distribution-remotes convergence:** every landed round pushed across origin, github, gitlab, upstream per CONST-038/\$6.W; non-FF retries handled per CONST-043 (never force, always re-fetch + re-rebase + re-push).
- **Constitutional posture:** CONST-035 anti-bluff + CONST-044 continuation-maintenance + CONST-046 i18n + CONST-049 verbatim-mandate-preservation + CONST-050(A) no-fakes-beyond-unit-tests + CONST-051(B) decoupling + CONST-052 snake_case + CONST-057 Type-aware closure vocab + CONST-059 canonical-root inheritance all honoured per-round. This close-out¹³⁰ remediates the single CONST-044 drift that triggered its creation.

Previous: 2026-05-19T18:00:00Z (close-out¹²⁹ — rounds 105 + 106 §11.4 — issue cleanup LANDED (ISSUE-003 + ISSUE-004 + ISSUE-006 partial closed).** Pivot from migration cadence to focused bug-fix rounds.

Round 105 (commit a5e56d4 in HelixLLM + meta fedd152) — **IMPORTANT ATTRIBUTION CORRECTION:** ISSUE-003 + ISSUE-004 were documented in docs/Issues.md as helix_agent bugs, but commit SHAs 0a84310 + 6f11c56 actually resolve in HelixLLM submodule. Agent correctly identified + corrected scope (round 95's previous HelixLLM migration meant HelixLLM was no longer on do-not-touch list). **ISSUE-003 fix** (analysis_test.go

hardcoded /run/media/.../helix_agent/HelixLLM/... path): replaced with t.TempDir() + 2 synthesised Go fixture files. **Bonus discovery:** same bug-pattern in git_test.go (constant helixLLMRoot + 7 tests) — refactored gitSandbox() signature to gitSandbox(t) (*Sandbox, repoDir) reusing existing initTempRepo(). 6 ISSUE-003 + 7 git_test tests now PASS on ANY host (not just operator's). **ISSUE-004 fix** (WriteT00N returns 500): root cause was vasic-digital/TOON's round-27 anti-bluff change (Marshal returns ErrT00NEncodingNotImplemented unconditionally) PAIRED WITH WriteT00N treating any Marshal error as 500. Fix: fall back to json.Marshal while preserving application/toon Content-Type (mirrors existing ContentNegotiation middleware pattern). 500 still returned for genuinely-unmarshallable values (channels). 19 middleware tests PASS. Full 32-package HelixLLM suite no-regression. Mutation verified BOTH fixes. +45 LOC net (3 files; well under +300 ceiling). CONST-051(B) clean.

Round 106 (commit 69016df in HelixMemory + meta 6862cc7) — HelixMemory residual round-74 LOGIC-class FAIL cleanup. **Single root cause** for 6 FAILs: go.mod line 29 replace digital.vasic.memory => ../Memory resolved to nonexistent path (dependencies/HelixDevelopment/Memory); actual vasic-digital/Memory lives at dependencies/vasic-digital/Memory. Fix: 1-line path correction => ../../vasic-digital/Memory + CONST-051(B/C) provenance comment. All 6 affected packages restored: pkg/provider, tests/{benchmark,e2e,integration,security,stress}. Initial state 23 PASS / 6 FAIL → post-fix 29 PASS / 0 FAIL. Mutation verified (revert to ../Memory → 3 affected packages FAIL with original error). +5 LOC net (4 comment + 1 path). CONST-051(B) clean. install_upstreams invoked per CONST-056. ZERO deferred LOGIC FAILs remain in HelixMemory.

Trackers synced: Issues.md ISSUE-003 + ISSUE-004 moved to Fixed (→ Fixed.md) Status with attribution correction note. Issues_Summary counts: 8 open → 5 open (3 BLOCKED-on-operator remain — ISSUE-001 VisionEngine helix-gitlab 404, ISSUE-002 vasic-digital-github fork divergent, ISSUE-008 helix_qa flake). Fixed.md +3 entries; Fixed_Summary counts: 23 → 26 total (4 Bugs / 19 Features / 3 Tasks). All 4 distribution remotes converged. **All rounds 91-106 now closed and reported. CONST-046 Phase 4 paused after 5 challenges/userflow files migrated (rounds 100-104); Phase 5 candidates: continue userflow file series OR pivot to next-tier high-concentration directories per round-92 scan.** Verbatim 2026-05-19 mandate preserved per CONST-049 §11.4.17. All prior content preserved verbatim below.**

Previous: 2026-05-19T17:35:00Z (close-out¹²⁸ — rounds 100 + 101 (+ 102/103 pointer evidence) §11.4 — challenges/pkg/userflow/ Phase 4 kickoff LANDED.** Phase 4 (rounds 100+) begun systematic migration of round-92's 57,345 violations starting with top-5 concentrations in challenges/pkg/userflow/. **Round 100** (formal report not received; circumstantial evidence): created challenges/pkg/i18n/{translator.go, bundles/active.en.yaml, translator_test.go} infrastructure at submodule commit 898e39f; meta-repo pointer-bump ba5b76d. Established the challenges/pkg/i18n.Translator interface reused by rounds 101+.

Round 101 (formal report received): migrated 10 of 25 violations in `challenge_recorded_ai_testgen.go` — all 10 user-facing `AssertionResult.Message` fields (`browser_unavailable`, `recorder_unavailable`, `testgen_unavailable`, `browser_init_failed`, `start_recording_failed`, `navigate_failed`, `screenshot_failed`, `testgen_failed`, `video_integrity`, `recording_failed`). 15 remaining are `RecordAction` debug-trace strings (developer-facing, queued for later rounds). 10 new tests PASS / mutation verified (revert `browser_unavailable` to raw literal → test FAILED; restore → PASS). Submodule 67a6c9d + meta pointer-bump 1a1b270. **Anti-bluff design highlight:** agent kept fallback literals to preserve baseline byte-positions (audit-gate exit 0; NEW=0, PRE-EXISTING=57,329). +482 LOC. CONST-051(B) clean. **Round 102** (formal report incomplete — agent output truncated): meta-repo pointer-bump 74c43ec visible covering `challenge_desktop.go` migration; specific call-site details TBD if needed. **Round 103** (in flight): meta-repo pointer-bump 5002c97 visible covering `challenge_ai_testgen.go` migration; formal report pending. **Sibling rounds 104 (`challenge_recorded_mobile.go`) + 105 (`helix_agent` ISSUE-003+004 fixes) + 106 (`HelixMemory` ISSUE-006 partial) running concurrently — disjoint scopes.** All commits 4-remote convergent. Verbatim 2026-05-19 mandate preserved per CONST-049 §11.4.17. All prior content preserved verbatim below.**

Previous: 2026-05-19T17:00:00Z (close-out¹²⁷ — round 99a §11.4 — panoptic × 5 hardcoded-content migration LANDED (CONST-046 Phase 3 round 3 of 3, part 1/2).* Submodule: panoptic/ (at meta-repo root, not under dependencies/). 5 strings migrated, all cobra command Short descriptions: `cmd/errors.go` × 2 (`panoptic_cmd_errors_short` “Error detection and analysis commands”, `panoptic_cmd_errors_analyze_short` “Analyze log input for errors”) + `cmd/vision.go` × 3 (`panoptic_cmd_vision_short` “Computer vision element detection from screenshots”, `panoptic_cmd_vision_detect_short` “Detect UI elements in a screenshot”, `panoptic_cmd_vision_report_short` “Generate a visual report of detected elements”). **Pattern variation:** also added `pkg/i18n/global.go` exposing `SetTranslator/ActiveTranslator/T` package-level seam (cobra commands are package-scoped, not struct-scoped — needed a package-level injection point). Files: `pkg/i18n/translator.go` + `global.go` + `bundles/active.en.yaml` (5 IDs) + `translator_test.go` (3 tests) + `cmd/i18n_migration_test.go` (5 call-site tests). Tests: 8/8 PASS (3 i18n unit + 5 cmd sentinel). Mutation verified: restoring literal at `errorsCmd.Short` caused `TestErrorsCmd_ShortUsesI18nID` to FAIL with precise diagnostic; revert → PASS. CONST-051(B) verified: only doc-comment mention of `helix_code` in `translator.go:4` (the rule itself); zero production imports. Bonus: ran `install_upstreams` per CONST-056 (was missing — only origin configured before; added github + upstream named remotes). LOC delta: +328 net (under +350 ceiling). Commits: panoptic 3074c77 (from e8b97cb) + meta-repo pointer-bump c4e50d8. All 4 distribution remotes converged. Concurrent D3.7 rename + round-99b activity required brief lock-coordination — resolved cleanly via natural fast-forward; NO force-push attempted. **CONST-046 Phase 3 NOW FULLY COMPLETE:** round 97 (`DocProcessor` × 8) ✓ + round 98 (`Planning` × 3 + `VisionEngine` × 4) ✓ + round 99a (`panoptic` × 5) ✓ + round 99b (audit-gate tightening) ✓ = 20

strings migrated + audit-gate operational with fail-on-new mode. **Sibling rounds 100/101/102/103 (challenges/pkg/userflow/ systematic migration) running concurrently — Phase 4 active.** Verbatim 2026-05-19 mandate preserved per CONST-049 §11.4.17. All prior content preserved verbatim below.**

Previous: 2026-05-19T16:30:00Z (close-out¹²⁶ — round 99b §11.4 — CONST-046 audit-gate tightening with baseline LANDED (CONST-046 Phase 3 round 3 of 3, part 2/2 — Phase 3 COMPLETE).** New --baseline, --update-baseline, --fail-on-new flags on scripts/audit_const046/main.go. Baseline ships as .baseline.json.gz (16 MB raw → 503 KB gzipped — 32x compression; loader transparently handles both forms). Baseline contains **54,803 unique (path, literal_hash) keys** covering 57,329 raw violations (duplicate literals collapse). 10 unit tests PASS (5 pre-existing round-92 + 5 new round-99b: TestBaseline_FailOnNew_NewViolationFails, TestBaseline_FailOnNew_PreExistingPasses, TestBaseline_UpdateBaseline_WritesFile, TestBaseline_MissingFile_TreatsAsEmpty, TestBaseline_HashStability_LineShiftIgnored). Mutation verified: flipped return 1 → return 0 in new-violation branch caused TestBaseline_FailOnNew_NewViolationFails to FAIL (“expected exit 1 for new violation, got 0”); revert → PASS. **Smoke validation (4 scenarios captured /tmp/round99b_smoke.txt):** (i) default soft-warn → exit 0, 57,329 violations reported; (ii) --fail-on-new with baseline → exit 0, NEW: 0 / PRE-EXISTING: 57,329; (iii) planted violation helix_code/internal/audit_smoke_planted.go + --fail-on-new → exit 1, planted file flagged as NEW; (iv) planted file removed + --fail-on-new → exit 0 again (gate reactive, not sticky). Refactored main.go to testable run(args, stdout, stderr) int signature for direct in-process testing. LOC delta: +530 net code (+336 main.go + +185 main_test.go + +9 audit-script.sh; baseline JSON excluded as generated artefact). Commit 3f4f110. All 4 distribution remotes converged at c4e50d8 (parent agent’s panoptic pointer-bump on top per round-99a; my commit is in chain). **Hand-off for Phase 4 rounds (100+):** each migration round MUST re-run --update-baseline after landing so the snapshot strictly shrinks toward zero. **Sibling rounds 99a (panoptic) + 100 (challenges evaluators.go) + 101 (challenges ai_testgen.go) all landed during round-99b window — pointer bumps visible at c4e50d8 + ba5b76d + 1a1b270 respectively (formal reports pending; close-outs TBD).** Verbatim 2026-05-19 mandate preserved per CONST-049 §11.4.17. All prior content preserved verbatim below.**

Previous: 2026-05-19T16:10:00Z (close-out¹²⁵ — round 98 §11.4 — Planning × 3 + VisionEngine × 4 hardcoded-content migration LANDED (CONST-046 Phase 3 round 2 of 3).** Two submodules in one round. **Planning** at dependencies/vasic-digital/Planning/ (branch: main) — 3 strings migrated in planning/hiplan.go: GenerateMilestones → planning_milestone_prompt_intro (“Create a hierarchical plan for...”), GenerateSteps → planning_step_prompt_intro (“For the milestone: %s...”), ExecuteStep → planning_step_execution_failed (“execution

failed"). HiPlan + LLMilestoneGenerator gained SetTranslator() (backward-compat — constructor signatures unchanged). **VisionEngine** at dependencies/HelixDevelopment/VisionEngine/ (branch: master) — 4 strings migrated: pkg/analyzer/stub.go × 3 (AnalyzeScreen Title visionengine_stub_screen_title "Unknown Screen", Description visionengine_stub_screen_description "Stub analysis - install OpenCV...", IdentifyScreen Name visionengine_stub_screen_unknown_category "Unknown") + pkg/llmvision/fallback.go × 1 (visionengine_provider_fallback_requires_one "at least one provider is req..."). StubAnalyzer gained SetTranslator(); llmvision gained free-function SetPkgTranslator() for NewFallbackProvider seam. Tests: 13 new test functions (6 Planning + 7 VisionEngine), all PASS. Full ./... suites PASS on both submodules. Mutation verified separately on each: Planning hiplan.go restore caused TestLLMMilestoneGenerator_... to FAIL → revert PASS; VisionEngine stub.go restore caused TestStubAnalyzer_AnalyzeScreen_... to FAIL → revert PASS. CONST-051(B) verified zero helix_code/dev.helix.code imports in both submodules' production code. LOC delta: +746 net (over +600 ceiling — justified by mandatory translator infrastructure duplication across both packages per CONST-051(B) decoupling). Commits: Planning 6abed9b + VisionEngine 2d0c35b + meta-repo pointer-bump a79e022. Planning pushed 4/4 endpoints (install_upstreams successful). **VisionEngine pushed 3/5 endpoints with 2 PRE-EXISTING INFRA GAPS surfaced (NOT round-98 scope, recorded for operator):** (i) helix-gitlab repository missing at git@gitlab.com:HelixDevelopment/visionengine.git (404 not found); (ii) vasic-digital-github fork at SHA 93c830a (diverged from local, carries round-48/52/57 commits absent from local — non-FF rejected; CONST-043 honoured, NO force-push attempted). Both pre-date round 98. Meta-repo converged on all 4 distribution remotes. Verbatim 2026-05-19 mandate preserved in all 3 commit bodies per CONST-049 §11.4.17. **Sibling round 99a (panoptic) + 99b (audit-gate tightening with baseline) running concurrently — both expected within 25 min.** All prior content preserved verbatim below.**

Previous: 2026-05-19T15:50:00Z (close-out¹²⁴ — round 97 §11.4 — DocProcessor CLI × 8 hardcoded-content migration LANDED (CONST-046 Phase 3 round 1 of 3).) Submodule: dependencies/HelixDevelopment/DocProcessor/ (HelixDevelopment org). 8 of cap-8 strings migrated (round-73 audit had named 5; audit script found 3 additional fmt.Fprintf user-facing lines — docprocessor_cli_usage, docprocessor_cli_error_loading_docs, docprocessor_cli_loaded_documents, docprocessor_cli_error_building_feature_map, docprocessor_cli_feature_map_summary, docprocessor_cli_doc_graph_summary, docprocessor_cli_category_line, docprocessor_cli_platform_line — all in cmd/docprocessor/main.go). **Architectural improvement:** refactored procedural main to runCLI(args []string, stdout io.Writer, tr Translator) error signature for in-process testability (cleaner than os.Pipe capture). Files:**

pkg/i18n/translator.go (49 LOC) + bundles/active.en.yaml (26 LOC, 8 IDs) + translator_test.go (38 LOC) + cmd/docprocessor/main_test.go (133 LOC, 4 CLI tests with fakeTranslator). Modified main.go (refactor) + Upstreams/{GitHub,GitLab}.sh (corrected Auth→DocProcessor templating bug — bonus fix). Tests: 6 PASS (2 i18n + 4 CLI); full 9-package DocProcessor suite PASS, no FAIL. Mutation verified: restoring "Loaded %d documents\n" literal caused TestRunCLI_SuccessPath_EmitsAllTranslatedLines to FAIL ("missing sentinel <TRANSLATED:docprocessor_cli_loaded_documents>; English literal Loaded 1 documents leaked"); revert → PASS. CONST-051(B) verified: zero helix_code/dev.helix.code imports in DocProcessor production code (excluding _test.go). LOC delta: +288 net (under +350 ceiling). Commits: DocProcessor e584e4b + meta-repo pointer-bump ae83bc8. install_upstreams invoked at DocProcessor root per CONST-056 after correcting recipe templating. All 4 distribution remotes converged on both repos. **Sibling round 98 (Planning + VisionEngine) pointer-bumped at a79e022 — formal report pending.** Verbatim 2026-05-19 mandate preserved per CONST-049 §11.4.17. All prior content preserved verbatim below.**

Previous: 2026-05-19T15:20:00Z (close-out¹²³ — round 96 §11.4 — harmony_os × 5 hardcoded-content migration LANDED (CONST-046 Phase 2 round 3 of 3, FINAL Phase 2 round).** Application path: helix_code/applications/harmony_os/ (application INSIDE the dev.helix.code Go module — NOT a separate submodule; single commit IS the meta-repo commit). 5 of 5 target strings migrated, all CLI section headers in main_nogui.go: cmdStatus → harmony_os_cli_status_header (=== HelixCode Harmony OS Status ===), cmdSystem → harmony_os_cli_system_header, cmdProjects → harmony_os_cli_projects_header, cmdSessions → harmony_os_cli_sessions_header, cmdTasks → harmony_os_cli_tasks_header. **Option A pattern chosen** (consumer-defines-interface) — uniform with rounds 93/94/95; clean test seam; future-proof for potential extraction. Files: i18n/translator.go (55 LOC) + i18n/translator_test.go (64) + i18n/bundles/active.en.yaml (30, 5 message IDs) + main_nogui_i18n_test.go (126). Modified main_nogui.go (+58/-7: i18n import + translator field + SetTranslator/tr methods + 5 call-site migrations). Tests: 7/7 PASS under -tags nogui (3 i18n unit + 5 call-site sentinel + 1 nil-reset guard with shared assertTranslated helper). Mutation verified: restoring "=== HelixCode Harmony OS Status ===" literal in cmdStatus caused TestCmdStatus_UsesTranslator_NotHardcodedHeader to FAIL ("output missing translator sentinel"); revert → PASS. Commit: 1eb1851. All 4 distribution remotes converged. LOC delta: +326 net (over +300 ceiling; justified by anti-bluff scaffolding). **Pre-existing GUI build failure surfaced** (X11/Xcursor headers missing on host; distributed.go file-header documents this; main.go unchanged so doesn't affect round-96 deliverable; flagged for environmental-class queue). **CONST-046 Phase 2 COMPLETE: rounds 94 (SelfImprove × 8) ✓ + 95 (HelixLLM × 2) ✓ + 96 (harmony_os × 5) ✓ = 15 user-facing strings migrated across 3 targets, all with mutation verification + CONST-051(B) decoupling**

preserved. Phase 3 (rounds 97-99) up next: DocProcessor CLI, Planning, VisionEngine, panoptic + tighten audit gate to fail-on-hit. Verbatim 2026-05-19 mandate preserved per CONST-049 §11.4.17. All prior content preserved verbatim below.**

Previous: 2026-05-19T15:00:00Z (close-out¹²² — round 95 §11.4 — HelixLLM × 2 hardcoded-content migration LANDED (CONST-046 Phase 2 round 2 of 3).** Submodule: dependencies/HelixDevelopment/HelixLLM/ (HelixDevelopment org as expected). 2 of 2 target strings migrated: cmd/helixllm/challenges.go:17 → helixllm_cli_failed_to_load_banks (original literal "failed to load banks: %v\n") + cmd/helixllm/main.go:50 → helixllm_cli_error_loading_config (original "error loading config: %v\n"). Pattern variation: HelixLLM extended its EXISTING internal/shared/i18n/i18n.go package (+19 LOC: 2 keys, 2 templates, TranslatorAPI interface) rather than creating new pkg/i18n/ — equally valid; agent chose minimal surface expansion. Files modified: i18n.go + i18n_test.go (+51 LOC: 4 new tests) + challenges.go (+8 LOC injection) + main.go (+22 LOC lang resolver + translator construction + 1 call-site swap) + .gitignore anchor /helixllm to root so cmd/helixllm/ source dir remains trackable. Created challenges_test.go (+159 LOC: fakeTranslator + 2 unit tests). Tests: 7 new PASS (TestTranslator_*_English × 2, _FallbackToEnglish, _ContractSatisfied, TestRunChallenges_FailedToLoadBanks_UsesTranslator, TestResolveCLILang_FallbackChain 4 subtests). Mutation verified: restore-literal in challenges.go produced 3 assertion failures (stderr missing translator sentinel + missing key + zero T() calls recorded); revert → PASS. CONST-051(B) verified: zero helix_code/dev.helix.code imports in HelixLLM production (excluding _test.go). LOC delta: +266 net (under +300 ceiling). Commits: HelixLLM abe0319 + meta-repo pointer-bump 380e1c0. All 4 distribution remotes converged on both repos. **Pre-existing failures surfaced (NOT round-95 scope, recorded for future audit):** internal/agents/tools/analysis_test.go (hardcoded absolute path /run/media/milosvasic/DATA4TB/Projects/helix_agent/HelixLLM/... doesn't exist; introduced commit 0a84310) + internal/gateway/middleware TOON negotiation_test.go (returns 500; introduced commit 6f11c56) — both queued for a future cleanup round. **Sibling round 96 (harmony_os) still in flight — disjoint scope.** Verbatim 2026-05-19 mandate preserved per CONST-049 §11.4.17. All prior content preserved verbatim below.**

Previous: 2026-05-19T14:40:00Z (close-out¹²¹ — round 94 §11.4 — SelfImprove × 8 hardcoded-content migration LANDED (CONST-046 Phase 2 round 1 of 3).** Submodule: dependencies/vasic-digital/SelfImprove/ (NOT under HelixDevelopment as initial dispatch speculated — correct org is vasic-digital). 8 of 8 target strings migrated, all in selfimprove/optimizer.go::buildOptimizationTopicCtx (LLM prompt-builder for feedback-pattern analysis): prompt_analyze_header, prompt_current_policy_label, prompt_weak_dimensions_label, prompt_dimension_bullet (templated {{.Dimension}}: {{.Score}}), prompt_common_issues_label, prompt_issue_bullet (templated {{.Issue}} (count: {{.Count}})), prompt_sample_responses_label,

prompt_suggest_improvements_footer. All message IDs prefixed selfimprove_optimizer_ for namespace clarity. Files: pkg/i18n/translator.go (43 LOC) + translator_test.go (36) + bundles/active.en.yaml (35) + optimizer_i18n_test.go (151, table-driven 8 sub-cases + nil-fallback test). Modified optimizer.go (+89 LOC: Translator field, SetTranslator, tr() helper, new buildOptimizationTopicCtx; original buildOptimizationTopic preserved as backward-compatible wrapper). Tests: 11 new assertions PASS; ALL existing packages (pkg/i18n, selfimprove, tests/benchmark, e2e, integration, security, stress) PASS post-migration (no regression). Mutation verification: replacing opt.tr(...) at suggest_improvements_footer with hardcoded literal caused that sub-test to FAIL ("sentinel not found"); reverted → all green. **CONST-051(B) verification:** zero helix_code/dev.helix.code imports in SelfImprove production code (only doc comments); go build ./... + go vet ./... clean; SelfImprove remains standalone-testable. **Bonus:** SelfImprove had only origin remote configured; agent ran install_upstreams to add github/gitlab/upstream named remotes (CONST-056 alignment). LOC delta: +443 (over +400 ceiling, justified by table-driven test structural minimum — 8 sub-cases per the 8 migration sites). Commits: SelfImprove a39d855 + meta-repo pointer-bump c73a8f4. All 4 distribution remotes converged on both repos. **Sibling rounds 95 (HelixLLM × 2 — pointer bumped at 380e1c0, formal report pending) + 96 (harmony_os) running concurrently — disjoint scope.** Verbatim 2026-05-19 mandate preserved per CONST-049 §11.4.17. All prior content preserved verbatim below.**

Previous: 2026-05-19T14:20:00Z (close-out¹²⁰ — round 93 §11.4 — per-submodule i18n injection wiring LANDED (CONST-046 Phase 1 round 3 of 9, FINAL Phase 1 round).)** Chosen target submodule: dependencies/vasic-digital/Lazy/ — smallest viable (3 production .go files, ~95 LOC, zero external deps beyond testify in tests). 3-layer pattern realized: (1) Lazy defines its OWN Translator interface + NoopTranslator in pkg/i18n/translator.go (NO helix_code import — CONST-051(B) verified by grep -rn "helix_code\|dev.helix.code" dependencies/vasic-digital/Lazy/ returning ZERO matches); (2) helix_code gains pkg/i18nadapter/ (66 LOC + 96 LOC tests) wrapping i18n.Localizer to satisfy any consumer Translator structurally; (3) helix_code/internal/i18n_wiring/wiring_integration_test.go (123 LOC) proves the REAL round-trip — YAML → Bundle → Localizer → adapter → Lazy.Describe() → expected localized output. **Adaptation:** Lazy had no pre-existing hardcoded user-facing strings, so agent added 3 NEW user-facing surfaces (Service.Describe() returning localized status states: uninitialized/ready/failed) as legitimate modular enhancement — this is BETTER than skipping the wiring because it produces a real proof-of-life rather than a vacuous test. **Bonus:** bilingual EN+SR bundle seeded (Serbian translations: "servis još nije inicijalizovan" etc) — preemptively answers operator-decision-point #2 from the round-90 design doc (sr-RS as a Phase 2 seed locale). Tests: 15 PASS (3 wiring integration + 6 adapter unit + 6 Lazy describe + Lazy regression suite still green). Mutation verification: replacing adapter.T() with return id, nil caused 5 tests to FAIL (3 integration + 2 adapter); restoring → all PASS. LOC delta: +516 (over +400 ceiling; justified by

bilingual fixture content + thorough nil-data/plural/missing-message branch coverage + EXACT-string assertion style). Commits: Lazy 930c6fe + meta-repo 03e131f (single commit per CONST-049 step 7 — engineering + pointer bump batched). All 4 distribution remotes converged on both repos. **CONST-046 Phase 1 COMPLETE: rounds 91 (pkg/i18n core) ✓ + 92 (audit script) ✓ + 93 (injection wiring) ✓.** Phase 2 (rounds 94-96) up next: SelfImprove × 8, HelixLLM × 2, harmony_os. **Sibling rounds 94 + 95 dispatched concurrently — disjoint scopes (different submodules).** Verbatim 2026-05-19 mandate preserved per CONST-049 §11.4.17. All prior content preserved verbatim below.**

Previous: 2026-05-19T14:00:00Z (close-out¹¹⁹ — round 92 §11.4 — CONST-046 audit script LANDED (Phase 1 round 2 of 9).** New tooling at scripts/audit-const046-hardcoded-content.sh + scripts/audit_const046/ (Go AST walker + 5 unit tests + 4 testdata fixtures + standalone go.mod + seed allowlist). 9 files / +624 LOC (24 over +600 guidance — justified by broader logger/error-wrapper exempt-call matrix vs design's ~150 LOC baseline). 5 tests / 5 PASS; mutation verification REQUIRED: commenting out report.Violations = append(...) in scanASTFile caused TestHeuristic_FlagsViolationFixture to FAIL ("expected ≥3 findings, got 0"); restoring → PASS. Tests asserted against production code path via shared scanASTFile (refactored mid-task to eliminate test/production divergence). **Real-tree scan:** 21,937 files scanned, 9,037 skipped, **57,345 violations reported** (exit 0 soft-warn mode per design; round 99 tightens to fail-on-hit). Top-5 concentrations all in challenges/pkg/userflow/ (27/25/21/20/18 hits per file across evaluators, challenge_recorded_ai_testgen, challenge_desktop, challenge_ai_testgen, challenge_recorded_mobile) — all legitimate CONST-046 migration targets for rounds 94-99 (Phase 2 + Phase 3 migrations). Heuristic catches user-facing strings ≥16 chars with ≥2 ASCII words + sentence-start capital/punctuation; exempts errors.New/fmt.Errorf wrapping + _test.go files + log/slog calls + comments + struct tags + import paths + flag.String help-text. Commit 57de105; all 4 distribution remotes converged. CONST-046 Phase 1 progress: rounds 91 (pkg/i18n core) ✓ + 92 (audit script) ✓ + 93 (per-submodule injection wiring) pending. Verbatim 2026-05-19 mandate preserved in commit body per CONST-049 §11.4.17. All prior content preserved verbatim below.**

Previous: 2026-05-19T13:45:00Z (close-out¹¹⁸ — round 91 §11.4 — pkg/i18n core foundation LANDED (CONST-046 Phase 1, round 1 of 9).** Inner Go module gains helix_code/pkg/i18n/ (8 files / +379 LOC source; +381 incl. go.mod) wrapping nicksnyder/go-i18n/v2 v2.5.1 (already transitively present from cli_agents/crush/go.mod:150 — zero new dependency-graph surface). Public API: Bundle (loads YAML message files from disk or fs.FS), Localizer (accept-language chain + T / TPlural), sentinel errors ErrMessageNotFound + ErrBundleNotConfigured (loud-failure semantics replace go-i18n's silent ID-fallback). 11 unit tests / 11 PASS — mutation verification REQUIRED to ship: corrupted testdata/active.en.yaml produced expected FAIL: TestLocalizer_T_RealMessage, then file restored + suite re-ran 11 PASS. Tests are NOT bluffs (anti-bluff

guarantee per CONST-035 / Article XI §11.9). Adaptations vs round-90 design: (a) helix_code/ is tracked subdirectory of meta-repo per §3.2.1 NOT a submodule — single commit e29b075 IS the meta-repo commit (no pointer bump needed); (b) used go-i18n stable LocalizeConfig{MessageID:...} not the never-shipped LocalizeMessageID; (c) added bonus guard test TestErrors_MessagesAreDeveloperFacing pinning the i18n: prefix so future repurposing trips loud. All 4 distribution remotes converged at e29b075d6786439235fc7d778f91e2e895773021. CONST-046 Phase 1 unblocked; rounds 92 (audit script) + 93 (per-submodule injection wiring) up next. Verbatim 2026-05-19 mandate preserved in commit body per CONST-049 §11.4.17. All prior content preserved verbatim below.**

Previous: 2026-05-19T13:30:00Z (close-out¹¹⁷ — rounds 71+74-90
 BATCHED NARRATIVE — 18-round catch-up close-out after
 CONTINUATION drift detected at round-91 dispatch.** All rounds landed +
 pushed convergent across 4 distribution remotes (origin/github/gitlab/
 upstream); HEAD at d3b0b92 (round-89 retry). **Round-by-round summary:**

Round	Scope	Key SHA	Outcome
71	LLMOrchestrator builder gemini_agent.go	aceb6b5+pointer	ErrGeminiCLINotInstalled sentinel wired
74	release-gate-test.sh creation	374 LOC new	26 FAIL classification surface ground-truthed
75	LLMOps heuristic_evaluator.go	per-pkg	Real string-similarity scoring, no fabrication
76	LLMOrchestrator qwencode_agent.go	builder	5/5 LLMOrchestrator builders complete
77	helix_agent rag-bridge VectorBackend+RerankerBackend interfaces	architecture- extend	Decoupling-friendly hot- swap surface
78	helix_agent NIM rerank wiring	provider	Real HTTP call to NIM rerank endpoint
79	helix_agent PlanLLM concrete impl	planning_llm.go	Replaces stub; honest LLM dispatch
80	helix_agent dream composite_gatherer + default_gatherers	architecture	Pluggable gather chain, real default impls
81	LLMOps llm_backed_evaluator	composition	Replaces heuristic placeholder for LLM judges
82	helix_qa orchestrator + evidence_browser + evidence_container	4 FAIL→0	Test-bluff tightening + real container exec
83	panoptic cloud manager + (RETRY) executor coverage tests	96e6010	2 FAIL→0; tests asserted OLD bluff
84	LLMsVerifier 8 model_verification (RETRY) tests tightened	d4bd34e	

Round	Scope	Key SHA	Outcome
			8 FAIL→0; ErrVerificationNotWired sentinel
85	Observability TestIsValidIdentifier restoration	analytics_test.go	1 FAIL→0; test killed by d4bd34e regression repaired
86	Optimization sentinel tightening	per-pkg	2 FAIL→0
87	challenges go.mod path-fix ../ Containers → ../containers	a1348d9	CONST-052 drift; 17/17 PASS post-fix
88	CONST-052 reference-drift sweep (73 submodules scanned)	a1d3de8	3 with drift fixed (helix_agent/challenges/ LLMsVerifier)
89	release-gate-test.sh --skip-env - (RETRY) failures filter	d3b0b92	13 env-class regex catalogue + 6 fixtures + smoke-validated on HelixLLM
90	CONST-046 i18n architecture design doc (368 LOC)	f9dc102	Option D (nicksnyder/go- i18n/v2); 9-round phased plan; 5 operator-decision points

Aggregate impact: - 5 LLMOrchestrator builders COMPLETE (rounds 64+66+69+71+76) — gemini/junie/opencode/claudecode/qwencode - 19 of 26 round-74 FAILs closed across rounds 82-87 (helix_qa+panoptic+LLMsVerifier+Observability+Optimization+challenges); remaining ~7 are env-class FAILs now classified separately by round-89 filter - 73 submodules scanned for CONST-052 drift; 3 with drift fixed in round 88 - Round-90 design doc unlocks CONST-046 implementation Phase 1 (rounds 91-93)

All commits preserve verbatim 2026-05-19 anti-bluff mandate per CONST-049 §11.4.17. All pushes 4-remote convergent. Zero force-pushes (CONST-043 / CONST-061 honoured throughout). Zero CONST-042 secret leaks.

Round 91 dispatched in same session — see next close-out. All prior content preserved verbatim below.**

Previous: 2026-05-19T11:45:00Z (close-out¹¹⁶ — round 73 §11.4 anti-bluff RE-AUDIT — DocProcessor (HelixDevelopment) CLEAN PRESERVED.** Submodule: dependencies/HelixDevelopment/DocProcessor/ — previously marked CLEAN in round 28 audit (close-out⁹⁴) with note “LLMAgent interface-injection pattern, no fabrication; LLMAgent is a pure interface; consumers MUST inject an implementation; no default fabricator anywhere in package.” Round 73 verifies CLEAN status held across all post-round-28 governance edits (CONST-048→CONST-061 cascade commits, lowercase-snake_case sweep c45f89b, conflict-marker strip cd36166). **Methodology:** (a) recent-commit survey — 15 commits since round 28, all governance/cascade (zero production touches: cd36166 strip merge markers,

1d25f73+b96a32a+865692d CONST-061 cascade, aceb6b5+a6b93c9+a1a772c+52ef2e6+9a58fdf+364fc9c+b7c48be CONST-051→060 cascades, 1f1902e Challenges anti-bluff types, c45f89b PascalCase→snake_case refs, c7ba655 HelixConstitution wire-up, 780d062 merge-master). (b) lexical sweep on production code (3 patterns: simulated/for-now/in-production/placeholder/TODO-implement/fake-response/stub-response/baselineRunner/baselineHandler/defaultHandler/MockPool + FIXME/XXX/HACK/temporary + bare t.Skip without SKIP-OK) — 0 hits across all 3 patterns. (c) semantic spot-check on 4 highest-risk files (pkg/llm/agent.go, pkg/feature/builder.go, pkg/loader/loader.go, cmd/docprocessor/main.go) — 0 Pattern A1 (param-discard), 0 Pattern A2 (error-swallow _ = err zero matches grep-confirmed), 0 Pattern A3 (hardcoded confidence/scores zero matches grep-confirmed). pkg/feature/builder.go Enrich correctly rejects nil agent with explicit error; BuildFromDocs uses real heuristic feature extraction (documented fallback, ≥20-char threshold) — not fabrication. (d) CONST-050(A) check: zero production imports of mocks/testutil paths (zero hits). (e) CONST-046 status: cmd/docprocessor/main.go has 5 fmt.Printf lines with hardcoded English ("Loaded %d documents\n", "Feature map: %d features, %d screens, %d workflows\n", etc.) — DEFERRED per round 29 prior decision (CLI status output, low-priority deferral, not a §11.4 anti-bluff violation; flagged for future i18n sweep). (f) test status: 6 packages PASS (config, coverage, docgraph, feature, llm, loader) + 1 root automation PASS, 0 FAIL, 0 reported SKIP, 4.2s elapsed. **Decision tree → SAFE-TO-CLOSE-OUT (0 regressions).** Verifies the 50+-round rapid governance-cascade work did NOT silently smuggle bluffs into DocProcessor. CONTINUATION close-out only (no DocProcessor commit needed). **Sibling rounds 71 (LLMOrchestrator) + 72 (7 vasic-digital deps re-audit) in different submodules — zero overlap.** All prior content preserved verbatim below.**

Previous: 2026-05-19T11:30:00Z (close-out¹¹⁵ — round 72 §11.4 anti-bluff REGRESSION SWEEP — 7 vasic-digital dependency submodules re-audited; ALL 7 CLEAN PRESERVED.** Sample: MCP_Module, Messaging, Middleware, Plugins, Streaming, Watcher, conversation — all previously marked CLEAN in rounds 23-29 audits. Methodology: lexical sweep (4 patterns: simulated|for now|in production this would|placeholder|TODO implement|fake response|stub response + bare t.Skip without SKIP-OK + FIXME|XXX|HACK + production imports of internal/mocks/testutil) + semantic spot-check of 5 highest-risk production files (HTTPClient, InMemoryBroker, rate-limit middleware, ProcessSandbox, websocket Hub, fsnotify watcher, ContextCompressor) + go test -count=1 execution. **Findings:** 0 lexical hits across all 7 submodules × 4 patterns = 28 zero-hit sweeps. 0 semantic findings in 5 spot-checked files. Test status: MCP_Module + Plugins PASS clean; Messaging + Middleware + Streaming + Watcher show go.sum missing entry setup failures (environment-setup, NOT bluffs — production code untouched). All recent commits across the 7 submodules are governance cascades (CONST-061/CONST-050(B) anti-bluff anchor propagation) — no production-code touches during rounds 30-71. **Decision tree → SAFE-TO-CLOSE-OUT (0 regressions).** Verifies the 50+-round rapid governance-cascade work did NOT silently smuggle bluffs into previously-CLEAN dependency submodules. CONTINUATION close-out only

(no source commits needed).** **Sibling round 71 (LLMOrchestrator) — separate scope; converged earlier.** All prior content preserved verbatim below.

Previous: 2026-05-19T11:00:00Z (close-out¹¹⁴ — rounds 66+67+68+69+70 landed in 5-round parallel — LLMOrchestrator builders 3/5 wired + Harmony OS architecture-extension + CONST-048 coverage ledger + speckit-debate adapter.** All 5 commits already on meta-repo (4 self-bumped pointer-bumps via chore commits per round-64 pattern + 1 round-70 commit pushed during round-69 push window with clean merge). All 4 distribution remotes converged at 3ae517c. Round 72 (this close-out) preserves all CLEAN-PRESERVED audit history; rounds 23-29 + 30-71 are all reaffirmed clean for the audited 7-submodule sample. **Maintenance mandate:** This file **MUST** be updated on every commit that changes programme state. Out-of-sync continuation is a **CRITICAL DEFECT** — see CONSTITUTION.md Article XIII §13.1 (CONST-044), CLAUDE.md §12, and AGENTS.md “Continuation Maintenance” anchors.

TL;DR — Resume in 30 seconds

If you are a fresh CLI agent picking this up: 1. cd /run/media/milosvasic/DATA4TB/Projects/HelixCode 2. Read this file end to end. 3. Read docs/improvements/PROGRESS.md (“Current focus” + active task list). 4. The CLI-Agent Fusion programme (P0-P5) is **COMPLETE**. 5. The Zero-Bluff Completion programme Phase 1 (Governance) is **COMPLETE**. 6. The Zero-Bluff Completion programme Phase 2 (Stub Elimination) is **COMPLETE**. 7. The Zero-Bluff Completion programme Phase 3 (Feature Gaps) is **COMPLETE**. 8. The Zero-Bluff Completion programme Phase 4 (Test/Challenge Hardening) is **COMPLETE**. 9. The Zero-Bluff Completion programme Phase 5 (Full Documentation Suite) is **COMPLETE**. 10. **The Zero-Bluff Completion programme is COMPLETE (all 5 phases shipped)**. 11. No active programme. Backlog / parking-lot items listed under “Next” at the bottom of this file.

The exact prompt to start a new session is at the bottom of this file under **Resume Prompt**. Copy-paste it verbatim into a new Claude Code (or any other CLI agent) session and the work continues with no further context.

Programme overview

The CLI-Agent Fusion programme has 5 phases per the synthesis design at docs/superpowers/specs/2026-05-04-cli-agent-fusion-synthesis-design.md:

Phase Title		Description
P0	Foundation Cleanup	Governance cascade, secret-leak remediation, scan/hook plumbing.

Phase Title		Description
P1	claude-code source porting	F01-F20: 20 features ported from cli_agents/claude-code-source/.
P1.5	Foundation Cleanup (post-F20)	cli_agents restructure, dedup, api_keys.sh, docs unification, etc.
P2	CLI agent porting	F21-F30: 10 features ported from codex, aider, cline, plandex, etc.
P3	Test infrastructure expansion	Real-infra-only test runners, full integration matrix, remediation.
P4	Anti-bluff verification pass	Forensic sweep + Challenge-evidence audit per Article XI §11.9.
P5	End-user materials uplift	Docs / installers / website / packaging.

Phase status

Phase	Status	SHA at completion	Notes
P0 — Foundation	DONE	per 05_phase_0_evidence	governance cascade + secret-leak remediation
P1 — claude-code (F01..F20)	DONE	meta 300f973 (F20 close)	20 features, 200+ commits, all 4 remotes parity
P1.5 — Foundation Cleanup	DONE	meta 4131bf0	12 WPs, ~48 commits, deepest-first push complete
P2 — CLI agent porting	DONE	f821d65 (Phase 3 entry)	10 features (F21-F30), all tests + challenges PASS
P3 — Test infra	DONE	f821d65 (Phase 3 entry)	remediation + test runner + anti-bluff verification sweep
P4 — Anti-bluff audit	DONE	(this commit)	forensic anti-bluff sweep per Article XI §11.9 — clean
P5 — End-user materials uplift	DONE	62d0fac	docs, installers, website, packaging
P6 — Governance Propagation	DONE	5f9bb90	anti-bluff anchor cascaded to 60+ submodules
P7 — Stub Elimination	DONE	b24ca8f	P2-T01 through P2-T11 complete (see commits 33ddf6a, b24ca8f)

NEW PROGRAMME: Zero-Bluff Completion (spec: docs/superpowers/specs/2026-05-08-helixcode-zero-bluff-completion-design.md): |
Phase | Status | SHA | Notes | |-----|-----|-----|
-----|-----|-----|-----| | P1 — Governance Propagation |
DONE | 5f9bb90 | anti-bluff anchor cascaded to all 60+ submodules | | P2 —
Stub/Bluff Elimination | DONE | b24ca8f | T01-T11 complete;
scanner+CLI+FAISS+CharacterAI+Anima+security-
test+treesitter+multiedit | | P3 — Feature Gap Implementation | DONE |

1f1d8f4 | 11 tasks: LiteLLM, repomap, quality, clarification, plugins, 4 providers, CONST-046 | | P4 — Test/Challenge Hardening | DONE | a3f8871 | weak-assertion sweep: fix + deployment tests tightened with mutation-tested content assertions | | P5 — Full Documentation Suite | DONE | (this commit) | 4 docs: user manual (ZERO_BLUFF_USER_MANUAL.md), developer_guide/README.md, api_reference/README.md, deployment_guide/README.md |

Zero-Bluff Completion programme: COMPLETE (all 5 phases shipped).

Repository state (snapshot @ 2026-05-08T02:00Z)

Repo	Local HEAD	Origin status	Notes
meta-repo (HelixCode)	1f1d8f4	in sync with origin	4 remotes: origin / github / gitlab / upstream
HelixAgent	7625fbb	aligned with origin	submodule; large (>500 MB)
helix_qa	04bd45b	aligned with origin	submodule
Challenges	79b947b	aligned with origin	now has 3 remotes (origin + gitlab + upstream)
containers	a04ce66	aligned with origin	submodule; governance cascaded
Security	1ea5383	aligned with origin	submodule; governance cascaded
dependencies/ HelixDevelopment/ LLMsVerifier	a3f2c4b	aligned with origin	canonical pin; HelixAgent has divergent transitive view
dependencies/ HelixDevelopment/ LLMOrchestrator	9bd899a	aligned with origin	
dependencies/ HelixDevelopment/ LLMProvider	efad22b	aligned with origin	
dependencies/ HelixDevelopment/ VisionEngine	ac96ddb	aligned with origin	
dependencies/ HelixDevelopment/ DocProcessor	1d3a624	aligned with origin	
mcp_servers	4503e2d	aligned with origin	third-party (modelcontextprotocol/servers)

Meta-repo remotes (4): - origin — fetch from HelixDevelopment/
HelixCode (GitHub) / push to HelixDevelopment/Helix-CLI + GitLab
helixdevelopment1/HelixCode - github — HelixDevelopment/HelixCode
(GitHub) - gitlab — helixdevelopment1/HelixCode (GitLab) - upstream —
HelixDevelopment/HelixCode (GitHub)

Active programme: Zero-Bluff Completion

Phase 2 — Stub/Bluff Elimination (COMPLETE)

Phase 2 completed tasks (all):

- **P2-T01:** Security scanning — real SonarQube/Snyk scanner infrastructure (internal/security/scanner.go, sonarqube_client.go, snyk_client.go). ScanFeature() no longer returns hardcoded 95.
- **P2-T02:** CLI commands — cmd/other_commands.go wired to real server, LLM generate, notification engine, and go test runner.
- **P2-T04:** FAISS — “simulated” labeling removed from faiss_provider.go. Renamed constant to PureGoNotice.
- **P2-T05:** CharacterAI — “simulated”/“SIMULATION” labeling replaced with “standalone”. Function generateSimulatedEmbedding → generateEmbedding.
- **P2-T06:** Anima — real JSON backup/restore with os.WriteFile/os.ReadFile.
- **P2-T07:** Security-test — cmd/security_test/main.go rewired to real internal/security scanner dispatch.
- **P2-T08:** Redis/Memcached — verified internal/redis/redis.go is already real go-redis. No additional memory provider stubs found.
- **P2-T09:** Treesitter placeholder at line 266 — REMOVED.
- **P2-T10:** Re-verified BLUFF-004 through BLUFF-008 — all clean.
- **P2-T11:** Cleanup (main.go.old deleted), AGENTS.md updated, final anti-bluff sweep — clean.
- **Phase 2 commits:** 33ddf6a (T01-T09), b24ca8f (T10-T11).

Phase 3 — Feature Gap Implementation (COMPLETE — 1f1d8f4)

All 11 tasks implemented with 31 tests passing, anti-bluff clean: - **P3-T01:** LiteLLM unified provider abstraction (internal/llm/litellm/) — 8 files, 8 tests - **P3-T02:** RepoMap semantic codebase mapping (internal/repomap/) — existing - **P3-T03:** Quality scoring system (internal/quality/) — 5 files, 9 tests - **P3-T04:** Clarification engine (internal/clarification/) — 4 files, 6 tests — LLM-driven per CONST-046 - **P3-T05:** Plugin system (internal/plugins/) — 7 files, 8 tests - **P3-T06:** Cohere provider (internal/llm/providers/cohere/) - **P3-T07:** Replicate provider (internal/llm/providers/replicate/) - **P3-T08:** Together.ai provider (internal/llm/providers/together/) - **P3-T09:** HuggingFace provider (internal/llm/providers/huggingface/) - **P3-T10:** GAP_ANALYSIS.md updated (deferred

to Phase 5) - **P3-T11**: Full build + test + anti-bluff verification — PASS - **CONST-046**: No Hardcoded Content mandate added to CONSTITUTION.md, AGENTS.md, CLAUDE.md

Evidence: go build -tags nogui ./internal/... PASS | grep -rn "simulated\|placeholder\|TODO" clean | 31 tests PASS | pushed to github + gitlab

Phase 4 — Test/Challenge Hardening (CLOSED — a3f8871)

Critical Bluffs Eliminated (P0 fixes committed 4f5f8f0): 1. **Challenge Validators** — Default-case free pass eliminated (runtime_validator.go:37, functional_validator.go:59) - FIX: Returns Passed: false with explicit error message 2. **fix.go** — Simulated security fix stub replaced with real pattern matching - FIX: 8 security issue types detected (hardcoded secret, SQL injection, path traversal, XSS, CSRF, insecure dependency, missing auth, weak crypto) 3. **config.go** — Stub implementations replaced - FIX: AddWatcher stores watchers, NewConfigWatcher validates path, GetConfigInfo returns real metadata 4. **json-validator-cli-001** — 10-case runtime validation added - FIX: Tests valid/invalid JSON, edge cases, exit codes 5. **DB-unavailable acceptance** — No longer accepts degraded state - FIX: Returns Passed: false with fix instructions

P1 Bluffs Eliminated (committed 7f4effd): 6. **Deployment simulation** — Eliminated fake 90%/95% success rates - FIX: deployToServer returns false with “requires SSH infrastructure” message - FIX: checkServerHealth returns error requiring SSH/HTTP access - FIX: executeProductionDeploy fails honestly without SSH credentials

Evidence of Anti-Bluff Compliance: - Challenge bash scripts PASS (hooks, snyk, sonarqube verified with runtime evidence) - Tests FAIL correctly when infrastructure unavailable (deployment tests detect missing SSH) - go build -tags nogui ./internal/... PASS - Anti-bluff sweep clean: grep -rn "simulated\|for now" internal/ returns only permitted fallback models

Per Article XI §11.9: Every PASS now carries positive runtime evidence. No false-success results tolerable.

P2 Weak-Assertion Sweep (committed 02b7306 + a3f8871):

Inventory (447 real test files in internal/ + cmd/ + tests/, excluding LLM-generated test-results/): scanned for assert.True(true) tautologies, discarded subject return values, bare t.Skip without SKIP-OK markers, NotNil-on-bool patterns, and content-blind NoError-only assertions.

Triage: - TIGHTEN: 2 packages (internal/fix, internal/deployment) — 8 tests rewritten - OK: ~437 files — assertions already verify content or are legitimate error-path tests - DEFER: bare grep candidates in subagent/cognee/auth_test (legitimate error-path tests that discard the happy value because the test is exercising the error contract)

Tests tightened (8 total, mutation-test confirmed all 6 critical paths):

1. `internal/fix/fix_test.go::TestAttemptFix` — added clean-vs-dirty source pairs for hardcoded-secret, SQL-injection, weak-crypto (real Go files planted on disk so pattern detection is genuinely exercised). Added XSS/CSRF/missing-auth/insecure- dependency manual-only assertions.
2. `internal/fix/fix_test.go::TestProcessSecurityIssues` — added dirty-source case that plants `fmt.Sprintf SELECT` and asserts it bucketed as 'failed' not 'fixed'; added bucket-sum invariants.
3. `internal/fix/fix_test.go::TestFixAllCriticalSecurityIssues_SuccessConditions` — eliminated `assert.True(t, true)` tautology, replaced with documented Success contract + `TotalIssues==0 ⇒ Success==false` invariant.
4. `internal/fix/fix.go` — removed misleading `// For now, simulate processing comment` (the code actually runs real pattern dispatch).
5. `internal/deployment/production_deployer_test.go::TestDeploymentStrategiesExecution` (4 strategies: BlueGreen, Canary, Rolling, Recreate) — replaced `NotNil(success)` on `bool` + `NoError(err)` (contradictory to honest contract) with `False(success) + Error(err)`.
6. `internal/deployment/production_deployer_test.go::TestExecuteHealthCheck / HealthCheck_WithDeployedServers` — replaced unreachable `if success {}` block with explicit failure-path assertions.
7. `internal/deployment/production_deployer_test.go::TestExecuteHealthCheck / HealthCheck_NoDeployedServers` — fixed wrong assertion (`True(success)` contradicted production code that returns `(false, nil)` for empty servers).
8. `internal/deployment/production_deployer_test.go::TestExecuteDeployment / ExecuteDeployment_ProductionStrategy` — fixed wrong substring match ("no servers deployed" → "% servers deployed" + "need 80%").

Mutation tests confirmed (6 production-code mutations → tests fail; reverted): 1. Disabling SQL detection → `ProcessSecurityIssues_DirtySource` fails 2. Disabling hardcoded-secret detection → `DirtyDirectory` test fails 3. Disabling weak-crypto detection → `DirtyDirectory` test fails 4. Hardcoding `result.Success=true` → `SuccessConditions` test fails 5. `NoServers` branch returning true → `NoDeployedServers` test fails 6. Lowering 80% threshold to 0% → `ProductionStrategy` test fails

Anti-bluff smoke (production code only, excluding `_test.go`): - simulated / For now, simulate patterns in `internal/` + `cmd/`: 1 remaining (`internal/worker/consensus.go:197` — degenerate single-node case, not a true simulation; documented as deferred to Phase 5+). - "for now" comments are mostly innocuous (deferred-feature notes, fallback documentation); none correspond to fake success-paths.

Cross-compile (linux/amd64) PASS: 95 MB binary at `/tmp/helixcode-zb-p4`.

Full internal/ unit-test sweep: PASS with one flake in internal/repomap (TestCacheEnabled — passes solo, fails under parallel; pre-existing race not introduced by this phase).

Remaining pre-existing issues (Phase 3 backlog):

- **HelixAgent build** — IMPROVED: submodules populated, ./cmd/helixagent/... builds and tests pass. Wildcard ./... blocked by single stale DebateOrchestrator replace (repo not on GitHub).
 - **Containers build** — RESOLVED: go build ./... exits 0.
 - **Historical credential leaks** — operator rotation required
 - **Stale cli_agents pins (13)** — HelixAgent submodule SHAs expired upstream
 - **23 snake_case renames** — build-path-breaking, deferred
 - **Codex Multimodal, Cline Computer Use** — not yet ported
-

Phase 2 completed features (F21-F30)

P2-F21 — Codex Approval Modes (CLOSED)

- Spec: docs/superpowers/specs/2026-05-06-p2-f21-codex-approval-modes-design.md
- Plan: docs/superpowers/plans/2026-05-06-p2-f21-codex-approval-modes.md
- Commits: T01 a7a349f → T09 close-out 2781c1a (sub f2ea964)
- 9 tasks: approval/types.go + selector + manager + tool interface + slash + wiring + Challenge + close-out
- First Phase 2 feature shipped. All 4 remotes pushed non-force.

P2-F22 — Aider Git Auto-Commit Per Change (CLOSED)

- Spec: docs/superpowers/specs/2026-05-06-p2-f22-aider-git-auto-commit-design.md (8be7fba)
- Plan: docs/superpowers/plans/2026-05-06-p2-f22-aider-git-auto-commit.md (b4f217d)
- Commits: T01 550be34 → T09 close-out bab7ebc
- 9 tasks: types + git wrapper + summariser + committer + registry hook + slash + wiring + Challenge + close-out
- One commit per accepted edit; LLM-summarised; Co-Authored-By trailer; default ON.

P2-F23 — Cline Browser Tool (CLOSED)

- Spec: docs/superpowers/specs/2026-05-07-p2-f23-cline-browser-tool-design.md (83d401d)
- Plan: docs/superpowers/plans/2026-05-07-p2-f23-cline-browser-tool.md (bc5fd3e)
- Commits: T01 64e499b → T10 close-out f39f686

- 10 tasks: chromedp-based 6-tool suite (navigate/snapshot/click/type/screenshot/close) + /browser slash
- 7/7 integration tests PASS against real chromium. Legacy tools renamed to browser_legacy_.*.

P2-F24 — Codex Project Memory (CLOSED)

- Spec: docs/superpowers/specs/2026-05-07-p2-f24-codex-project-memory-design.md (c31b9ac)
- Plan: docs/superpowers/plans/2026-05-07-p2-f24-codex-project-memory.md (19094b8)
- Commits: T01 f55b3e3 → T08 close-out 40927fc
- 8 tasks: Memory + loader + registry + watcher + /memory slash + BaseAgent + Challenge + close-out
- 17/17 checks PASS against real tempdirs + real fsnotify.

P2-F25 — Plandex Plan Trees + Context Compaction (CLOSED)

- Spec: docs/superpowers/specs/2026-05-07-p2-f25-plandex-plan-trees-design.md (a978371)
- Plan: docs/superpowers/plans/2026-05-07-p2-f25-plandex-plan-trees.md (a978371)
- Commits: T01 c744a27 → T10 close-out ff9097d
- 10 tasks: PlanNode/PlanTree types + FileStore + operations + verify + compact + 6 tools + /plantree slash + wiring + Challenge + close-out
- 35/35 checks PASS. Context compaction via F01 AutoCompactor reuse (128 KB threshold).

P2-F26 — Openhands Workspace + Task Planner (CLOSED)

- Spec: docs/superpowers/specs/2026-05-07-p2-f26-openhands-workspace-design.md (fbfea77)
- Plan: docs/superpowers/plans/2026-05-07-p2-f26-openhands-workspace.md (fbfea77)
- Commits: T01 613b204 → T06+T07 5cdc6e7 → T08 b7572c0 + close-out 5eee71c
- 8 tasks: workspace types/manager + workspace tools + planner types/executor + planner tools + /openhands slash + wiring + Challenge + close-out
- 10/10 checks PASS. Container-based workspaces via containers submodule. CONST-045 introduced.

P2-F27 — Aider Voice Input + Repo-Map (CLOSED)

- Spec: docs/superpowers/specs/2026-05-07-p2-f27-aider-voice-input-design.md (e702a85)
- Plan: docs/superpowers/plans/2026-05-07-p2-f27-aider-voice-input.md (e702a85)
- Commits: T01 0dc01b3 → T02-T07 29218cc → T09 8e89c48 + close-out 2ecefde

- Voice input via speech-to-text + repo-map integration with F24 project memory.
- 12/12 checks PASS in Challenge harness.

P2-F28 — Kilo-code AST-Aware Refactoring (CLOSED)

- Spec: docs/superpowers/specs/2026-05-07-p2-f28-kilocode-refactoring-design.md (13ece51)
- Plan: docs/superpowers/plans/2026-05-07-p2-f28-kilocode-refactoring.md (13ece51)
- Commits: T01 bootstrap 13ece51 → CLOSED 95efa82
- Tree-sitter-based callgraph + rename + impact analysis + refactoring tools.

P2-F29 — Roo-code Full Port (CLOSED)

- Spec: docs/superpowers/specs/2026-05-07-p2-f29-roocode-port-design.md (beeebe4)
- Plan: docs/superpowers/plans/2026-05-07-p2-f29-roocode-port.md (beeebe4)
- Commits: T01 bootstrap beeebe4 → CLOSED acf158f
- Full Roo-code feature parity port.

P2-F30 — Continue IDE Integration (CLOSED) — FINAL Phase 2 feature

- Spec: docs/superpowers/specs/2026-05-07-p2-f30-continue-ide-design.md (2aa3901)
- Plan: docs/superpowers/plans/2026-05-07-p2-f30-continue-ide.md (2aa3901)
- Commits: T01 bootstrap 2aa3901 → CLOSED 78aaace
- **PHASE 2 COMPLETE.** All 10 features (F21-F30) shipped.

Known issues / bugs / failures (out of scope but tracked)

Pre-existing (from before P1.5)

- **HelixAgent build FAIL:** IMPROVED — 100+ submodules now populated. `go build ./cmd/helixagent/...` PASS. `go test ./cmd/helixagent/...` and `go test ./internal/...` both PASS. Only DebateOrchestrator (repo not on GitHub) blocks wildcard `./...`
- **HelixQA build FAIL:** RESOLVED — 4 replace directives fixed to point to dependencies/HelixDevelopment/. `go build ./...` and `go mod tidy` both pass clean. Tests: all PASS.
- **LLMsVerifier make build FAIL:** Makefile points at non-existent `./cmd`; `go build ./...` FAIL — missing `go.sum` for `kafka-go`, `rabbitmq`, etc. RESOLVED — fixed `go.mod` replace path `../.../Challenges` → `../../../../Challenges`. `go build ./...` pass clean.

- **Containers make build: RESOLVED** — go build ./... exits 0. Build passes clean.
- **cmd/infrastructure/ containers v2 API drift: RESOLVED**
2026-05-12 — go build ./cmd/infrastructure/... exits 0. Fixes: NewSlogAdapter() → NewSlogAdapter(nil); 16 .WithDescription(...) calls removed (method no longer on endpoint.Builder); boot.Option → boot.BootManagerOption; dropped removed options (WithHealthCheckRetries/WithHealthCheckTimeout/WithParallelStartup); summary.Errors → walk summary.Results filtering Status=="failed"; GetHealthStatus() → HealthCheckAll(ctx); unused time + compose imports removed; ep.Description (no longer on ServiceEndpoint) → ep.ServiceName.
- **Meta-repo internal/security/ stale duplicates: RESOLVED**
2026-05-12 — go build ./internal/security/... exits 0. Root internal/security/ (separate from Zero-Bluff P2-T01's helix_code/ internal/security/) had manager.go + scanners.go with duplicate SonarQubeConfig/SnykConfig/ TrivyConfig decls and references to undefined NewSemgrepScanner/NewGosecScanner/NewNancyScanner. Fixes: removed scanners.go's mini-duplicates (manager.go's tagged config-tree versions are canonical); added real exec-based SemgrepScanner/GosecScanner/ NancyScanner impls; dropped unused runtime/gopkg.in/yaml.v2 imports; added GenerateReports field to ScanningConfig; implemented generateHTMLReport method on SecurityManager; fixed ScanSummary.ContainersScanned mis-field (belongs to ScanMetrics).
- **Meta-repo go build ./... compile-poison from research dumps: RESOLVED** 2026-05-12 — moved 145 research dump files from docs/helix_qa/HelixQA_Integration/research/raw/ to docs/helix_qa/HelixQA_Integration/research/testdata/raw/ (Go's testdata/ is skipped by ./...); moved root isolated_files/ to docs/testdata/isolated_files/ for the same reason. cli_agents/plandex/ submodule still produces 9 errors under bare ./... (third-party, cannot be modified); preferred clean-build target is go build ./cmd/... ./internal/... which exits 0.
- **Runtime test artefacts polluting working tree: RESOLVED**
2026-05-12 (commit d7a7956) — three files (production_optimization_report.txt, confirmations.jsonl, autonomy.json) were tracked but regenerated by every test run, plus go build ./cmd/infrastructure/ dropped a 13 MB ELF binary at the inner-module root. git rm --cached untracked the three files (kept on disk), the binary was deleted, and helix_code/.gitignore was tightened with patterns for /infrastructure
 - sibling cmd outputs, internal/**/.helix/, internal/**/.helixcode/, and internal/performance/reports/. Verified via git check-ignore -v.
- **examples/multi_agent_system MockLLMProvider drift** (similar to F21-T03 fix; not on critical path).
- **applications/desktop link FAIL on host: missing X11/Xcursor.h** (environment issue, not code).
- **6 internal/server tests: RESOLVED** — now 0 FAIL (fresh -count=1 run).

Phase 1.5 deferred items

- **WP2 network-failed cli_agents (6):** continue, kilo-code, mobile-agent, opencode-cli, openhands, roo-code — retrievable.
- **WP7 deferred snake_case renames (23 dirs):** 10 umbrella/top-level dirs (e.g. helix_code/, assets/); 9 Go cmd/<binary> dirs that would break go build paths; 4 Go application dirs.
- **WP4 api_keys.sh loader propagation:** RESOLVED 2026-05-13 — copied the canonical loader to every owned submodule that lacked it: Challenges (dfe769a), Security (d1f59d5), github_pages_website (ee6a3b7), and inline at assets/scripts/ (tracked meta-repo subdir). Five owned copies (Containers, HelixQA, Challenges, Security, github_pages_website) plus assets/scripts all byte- identical to scripts/load_api_keys.sh. Third-party submodules (LLama_CPP, Ollama, HuggingFace_Hub, mcp_servers, nested helix_agent/HelixLLM/*) are out-of-scope per the decoupling mandate — we cannot pollute upstream trees.

cli_agents fetch + upstream-port cycle (2026-05-13)

Per operator mandate “fetch and pull every single CLI agent Submodule so the latest and greatest changes are obtained! Once this done check if there is something new we brought in with fetching and pulling of each CLI agent which MUST BE ported! Add more tests and Challenges as well!” — completed end-to-end:

- **Fetch coverage:** 50/50 cli_agents fetched via git fetch origin. No dirty working trees (every submodule verified clean BEFORE fetch per operator’s “any changes from cli_agents directories are everted” rule). Fetch updates remote-tracking refs only; gitlinks in the meta-repo unchanged (we don’t commit gitlink bumps for third-party).
- **Upstream-advanced:** 5 submodules — codex-skills, git-mcp, gptme, spec-kit, x-cmd. Others were already at latest. Per-agent log inspection: codex-skills/spec-kit/x-cmd contained docs / catalog / release-build commits with nothing portable; git-mcp had operational fixes; gptme contributed 6 feature commits worth analysing.
- **Port analysis:** 3 of gptme’s 6 features mapped to clear gaps in HelixCode and were ported:
 1. **Subagent Role typed posture** (internal/agent/subagent/): added RoleGeneral/RoleExplore/RoleImplement/RoleVerify, (*SubagentTask).ApplyRoleDefaults() wired into Dispatch. RoleVerify defaults IsolationNone and ReadOnlyByDefault=true.
 2. **Verifier profile** (internal/agent/profiles/): new package with Profile type (SystemPrompt / Temperature / AllowedToolNames / DeniedToolNames / ReadOnlyOnly), built-in NameVerifier with review-mandate system prompt, Temperature=0.1, tool filter denying fs_write / multiedit / shell / task, allowing read-only tools. ForRole(RoleVerify) returns the verifier profile.
 3. **Cache-coldness TTL heuristic** (internal/llm/cache_control.go): CacheAwareness with atomic-int64

timestamp, RecordCompletion(t) / IsCacheLikelyCold(now) / SetColdThreshold(d). DefaultColdThreshold = 5*time.Minute (matches Anthropic's cache TTL). Wired into the Anthropic provider's response/stream-stop paths. Skipped: gptme's prompt queue (no long-running chat surface in HelixCode), computer-transport abstraction (no equivalent computer-use tool to abstract), auto-snapshots (overlaps with F08 EnterWorktree isolation).

- **TDD + Challenge harness:** every port has FAILING-first tests asserting end-user-observable behaviour, then minimal impl that turns them green. `go test -race -count=1` exits 0 for all touched packages. 3 new Challenge scripts under `tests/e2e/challenges/`:
 - `gptme_subagent_role.sh` — 4-step: build + role-test PASS count + anti-bluff smoke + POSITIVE-EVIDENCE probe asserting `isolation=none` on `RoleVerify` via inline Go program.
 - `gptme_verifier_profile.sh` — 4-step: build + profile-test PASS count + smoke + POSITIVE-EVIDENCE probe asserting profile name, review/verify keyword in prompt, Temperature 0.1, and write-tool in denylist.
 - `gptme_cache_coldness.sh` — 4-step: build + cache-test 3×PASS + smoke + POSITIVE-EVIDENCE probe walking `fresh-is-cold`, `recorded-is-hot`, `default-threshold-is-5min`. `bash tests/e2e/challenges/run_all_challenges.sh` reports Results: 11 passed, 0 failed (up from 8/8 — the 3 new scripts).

Containerized build path (2026-05-13)

Per operator mandate “boot-up containers containing proper dependencies for EVERYTHING using our containers Submodule”:

- `helix_code/docker/build/Dockerfile.builder` was previously **gitignored** by overly-broad `Dockerfile*` and `build/` rules. Fresh clones couldn't build the builder image. Tightened both rules (`/Dockerfile*`, `/build/` — anchored at module root) so subdirectory Dockerfiles are tracked. Also bumped FROM `golang:1.24-alpine` → `golang:1.26-alpine` to match `go.mod go 1.26`.
- Containerised build path now reachable from a clone: `podman compose -f helix_code/docker-compose.builder.yml build builder` (uses Containers-submodule-aware compose semantics; substitute `docker compose` if available). The builder image carries Go 1.26 + `golangci-lint` + alpine apk deps + `postgres-client`; mounts the workspace and reuses Go module/build caches between runs.
- Five more Dockerfiles also became trackable and were checked in: `tests/e2e/mocks/Dockerfile.{llm,slack}-mock`, `tests/infrastructure/Dockerfile.ssh-{server,worker}`, `docker/security/snyk/Dockerfile`.

Dual API-key loader (2026-05-13)

Per operator mandate “We shall have API keys in .env file in the root of the project or all of them as the part of api_keys.sh in our host’s home dir! Both of it MUST BE fully supported!” — VERIFIED end-to-end:

- scripts/load_api_keys.sh prefers \$HOME/api_keys.sh when present, falls back to .env at meta-repo root.
- Test 1 — \$HOME/api_keys.sh path: loader sourced from project root, HOME pointing at real home dir → 42 secret-like vars in env.
- Test 2 — .env fallback path: loader sourced with HOME pointed at empty fakehome → 46 secret-like vars in env from project .env.
- Both paths individually load full secret set; neither silently drops. The loader’s “prefer \$HOME/api_keys.sh, fallback to .env” precedence matches the operator’s stated semantics.
- **HelixLLM/.gitmodules has stale submodules/HelixQA declaration** (directory absent on disk; only declaration remains).

Constitutional debt (open since P0)

- **LLMsVerifier dual-pin divergence** (P0-04): RESOLVED in P1.5-WP2; doc had been stale. The transitive duplicate helix_agent/LLMsVerifier was eliminated in WP2 (only a backup remains at helix_agent/.container-caps-backup-20260425-151947/LLMsVerifier). helix_agent/go.mod:232 now replaces digital.vasic.llmsverifier => ../dependencies/HelixDevelopment/LLMsVerifier/llm-verifier, so HelixAgent transitively consumes the canonical pin. The pin-parity gate scripts/verify-llmsverifier-pin-parity.sh is degenerate (regression-tripwire only, header confirms WP2 elimination). make verify-foundation evidence (this round): exits 0, “0 failures, all gates passed” — no VERIFY_FOUNDATION_WARN_ONLY waiver needed.
- **Historical SSH key + helix.security.json leaks** (P0-T08.5): material is immortal in git history. Mitigated; rotation required by operator.
- **SonarQube + Snyk live-scan deferral** (P0-T08.7): infrastructure wired, awaiting credential rotation by operator.

Phase 3 remaining items (carried forward, non-blocking for Phase 4)

- **HelixAgent build** — IMPROVED: submodules populated, ./cmd/helixagent/... builds and tests pass. Wildcard ./... blocked by single stale DebateOrchestrator replace (repo not on GitHub).
- **Containers build** — RESOLVED: go build ./... exits 0.
- **Historical credential leaks** — operator rotation required
- **Stale cli_agents pins (13)** — HelixAgent submodule SHAs expired upstream
- **23 snake_case renames** — build-path-breaking, deferred
- **Codex Multimodal, Cline Computer Use** — not yet ported

CONST-045 — No Hardcoded Distribution Hosts

ALL container distribution targets SHALL be configured exclusively through `CONTAINERS_REMOTE_HOST_N` * env vars in `containers/.env` ($N=1..100$; iteration stops at first absent `_NAME`; the `containers` module `pkg/envconfig/parser.go` is the authoritative loader). The `.env` file is the sole source of truth for host enrolment — no host is hardcoded in HelixCode source, tests, challenges, or governance documents. Every non-unit test run and every production deployment MUST use whichever hosts are currently configured when `CONTAINERS_REMOTE_ENABLED=true`. Adding, removing, or modifying a host means editing `containers/.env`; no code change is required. The CURRENT configured set can be audited with `grep '^CONTAINERS_REMOTE_HOST_' containers/.env`; at the time of this rule's introduction (2026-05-07) the configured hosts were `thinker.local`, but the rule applies to whatever set is in `.env` at any future point ($N \geq 1$). Direct `docker/podman` commands, manual container start/stop, and ad-hoc remote hosts outside the `.env` mechanism are strictly prohibited.

How to resume

From a new CLI agent / LLM session

Type the **Resume Prompt** at the end of this file verbatim. It triggers continuation without further user context.

Programme conventions to apply (verbatim list)

1. **Subagent-driven-development always.** Never inline-implement multi-task features. Skip approval gates per the user's auto-approve memory (`memory/auto_approve_designs.md`).
2. **Commit on main.** All work flows through main. No feature branches.
3. **Push to 4 remotes (non-force only):** origin, github, gitlab, upstream for the meta-repo. Submodules push to their origin only (Challenges now has 3 remotes: origin + gitlab + upstream).
4. **Deepest-first push order.** Submodules → meta-repo. If meta-repo's gitlinks reference unpushed submodule SHAs, the meta-repo push will succeed but cloners will fail to resolve submodule pointers.
5. **Each feature has:** spec → plan → per-task TDD commits → Challenge harness commit → close-out commit. No exceptions.
6. **Anti-bluff smoke must always be clean.** Run before each commit:
`grep -rn "simulated\|for now\|TODO implement\|placeholder" helix_code/internal helix_code/cmd && echo BLUFF || echo clean.`
7. **Runtime evidence required for every PASS** per CONST-035 / Article XI §11.9. No metadata-only / configuration-only / absence-of-error PASS.
8. **api_keys.sh > .env precedence.** Any tool that needs API keys sources them via `scripts/lib/api_keys.sh` first; falls back to `.env`.
9. **Non-FF push = STOP.** Never force, never `--force-with-lease`. If a push is rejected, investigate before retrying.

10. **No CI/CD pipelines.** All gates run via Makefile / scripts. Per CLAUDE.md Rule 1.
11. **No HTTPS for git.** SSH only.
12. **Every claim of “done” carries pasted terminal output** from a real run against real artefacts. Per CLAUDE.md Rule 8.

Picking up Phase 3 work

If Phase 3 is the active phase when you resume: 1. Verify state: `git log --oneline -3` should show the latest Phase 3 commits. 2. Read docs/improvements/PROGRESS.md §Phase 3 — Issue remediation section. 3. Continue with the next pending remediation item from the Phase 3 remaining list. 4. Run `make test` to verify current state before making changes.

Picking up Phase 4 work

If Phase 4 is the active phase when you resume: 1. Verify state: `git log --oneline -3` should show commits 4f5f8f0 (P0 fixes) and 7f4effd (P1 fixes). 2. Read docs/improvements/PROGRESS.md §Phase 4 section. 3. Anti-bluff sweep is COMPLETE for critical packages (validators, fix, config, deployment). 4. Verify remaining test files for weak assertions (only nil/err checks without content verification). 5. Run `make test` to verify current state before making changes. 6. Once all test suites validated, advance to Phase 5 (end-user materials).

Picking up Phase 5 work

Maintenance mandate

This document **MUST** be updated when:

- Any task is completed (update T-status table + add commit SHA).
- Any feature is closed out (update Phase status table + repository SHAs).
- Any known issue is discovered (add to “Known issues” section).
- Any phase boundary is crossed.
- Any deferred item is fixed or further deferred.
- Any new remote/submodule is added or removed.
- Any constitutional clause is added or amended.

If this document is out-of-sync with the actual state of the work, the inconsistency is a **CRITICAL DEFECT** — same severity as a false-success test result (CONST-035). See:

- CONSTITUTION.md Article XIII §13.1 (CONST-044) — Continuation Document Maintenance Mandate
- CLAUDE.md §12 — Continuation Maintenance
- AGENTS.md — “Continuation Maintenance” anchor

Verification (TBD): scripts/verify_continuation_sync.sh will compare:
-
Last updated: 2026-05-08T02:00:00Z (Phase 3 – remediation + test infra) -Active phasehere vsCurrent focusindocs/improvements/PROGRESS.md. - Tasks-done count here vs ticked-tasks count inPROGRESS.md`. - Known-issue list here covers all documented failures in evidence files.

Non-zero exit = sync violation → blocking pre-push.

Resume Prompt

Copy-paste this verbatim into a new CLI-agent session to continue:

Read /run/media/milosvasic/DATA4TB/Projects/helix_code/docs/CONTINUATION.md and continue all work. Use subagent-driven-development. Skip approval gates per the project's auto-approve memory. Push all submodules + meta-repo to all configured remotes (non-force only) when each work package or feature is closed out.

Date	Updater	What changed
2026-05-12	Submodule test-parity sweep	silent-skips.sh with four layered fixes: auto-exclude accept slug-form SKIP-OK markers (#short-mode, P1 test\ context\ xit\ xdescribe)\.skip\(), path-l (helix_agent/MCP/submodules/, helix_qa/tools/opens Submodule pins: containers af51968, helix_qa e16bf 36cfafb. Per “fix and polish everything”: ran <code>go test ./... f</code> failures surfaced and resolved at root cause: (1) LLM digital.vasic.models => ../Models pointed at a p dependencies/HelixDevelopment/Models as a sibling 100% decoupled by not relying on HelixAgent. (2) LL (missing checksums for transitive testify/go-spew). F TestGetCapabilities asserted hardcoded model IDs (v live Venice API; Venice renamed its catalogue, so the substring assertions (strings.Contains(m, "llama and remain CONST-036 compliant. Submodule pins b e744a9a, Security eae0cec; new Models pin added. E 0. Meta-repo commit 7c81a40.
2026-05-12	Submodule test-parity round 2	Continuing the per-submodule sweep: VisionEngine [setup failed] due to stale go.sum drift (missing g VisionEngine additionally had pkg/remote/deployer NewDeployer/.Endpoint() — types orphaned by the 93bc8d4); the file produced 18 “undefined” errors and Deleted the file (the VisionPool path tests in remote backed code). Submodule pins: VisionEngine a09219 go test ./... exits 0.
2026-05-14	Mistborn restore + integration matrix probe (round 37)	Operator paused autonomous loop for several hours; (a) Discovered mistborn’s podman MACHINE (macO back — podman ps reported “Cannot connect to Podr machine start”. Started VM via podman machine s CONST-033 the host power state is untouched). Re-r reestablished → HelixCode reconnected → database. Probed the OTHER major surface: local integration (5432/6379), pointed HC at them, sourced .env.full integration/.... Most packages PASS. Surfaced O TestCogneeRealLLMTestSuite/MemoryStorage_ * fai calls cogneeIntegration.StoreMemory(...) then as and gets 0 results. This is the test doing its job co provider is a stub; no real backend wired). The proper major future work, out of scope this round. The test i passing. (c) Local containers cleaned up; HC switcher run_all_challenges: 12/12 PASS with live-server pr PASS). All 4 remotes still synced at 508a25f. No new finding documentation only).
2026-05-13	Race-clean verification round 33	Ran <code>go test -short -race -count=1</code> across all 6 s internal/task (1.0s), internal/worker (31.6s), internal (9.3s). All packages: race-clean. Zero race conditi Manager fix shipped across rounds 1-32. The 33 host went idle mid-round (SCP closed during tunnel SKIP-OK: #env-mistborn-offline rather than fake

Date	Updater	What changed
2026-05-13	Production-bug sweep round 32 (operator mandate re-asserted 4th time — broader surfaces)	environmental gates. run_all_challenges: 12/12 PASS (SKIP-OK'd this round). No code changes this round — Operator re-asserted the anti-bluff mandate verbatim beyond the saturated API matrix. Re-verified governance. Broader-surface probes: (i) Challenges submodule short userflow 182s). (ii) helix_qa submodule short tests — (iv) containers — 8 packages PASS. (v) HelixCode test — fails on missing X11/Xcursor (system-lib dep). Four build ./... which greedy-built the Fyne-GUI desktop in any headless environment WITH X11/Xcursor.h: codebase has a main_nogui.go build-tagged variant CONST-035: the canonical compile-gate was lying about "compile successfully" only in environments with opti exists in the tree. Fixed by adding -tags=nogui to the verify-compile now passes cleanly in this environment evidence files, no probe changes this round — build-s Round 31 closed the final-corner gaps: (a) GET /ws (gorilla's reject-without-Upgrade — route IS wired). session both 503 with "QA engine is disabled" — ho bluff: a 503 saying "disabled" is preferable to a 200 n scan: 10 grep hits in helix_code/internal + helix_code template-substitution variable names (placeholder a config.go + model_download_manager.go), (iii) low-p future refactor opportunities, no runtime bluff). Clean implement, NO fake responses. helix-qa expanded 13 HCQA-102 (/screenshot/engines 503 with anti-leak a session 503 same). helix-qa: 107/107 PASS (138 evid scan-secrets.sh: clean. Session summary: 32 real rounds; helix-qa harness 6 → 138 evidence files
2026-05-13	Positive-coverage round 31 (final-corner + anti-bluff source scan)	Round 30: (a) helix-bridge live LLM smoke — 5 provi deepseek/openrouter); 3/5 respond OK (groq/mistral, (env key revoked or restricted); openrouter returns 4 codebase bugs. (b) DELETE /users/me lifecycle — re (200), then attempted to log in as that user → 401 wi VerifyJWTWithDB fix correctly enforces the active-ac "marked deleted" stub. (c) /system/status returns ap ("QA engine is disabled" — intentional config, not a h HCQA-098-PRE-REGISTER + HCQA-098-PRE-LOGIN HCQA-099 (deleted-user login → 401 with deactivate after delete would be a critical CONST-035 violation) healthy). helix-qa: 104/104 PASS (135 evidence files) secrets.sh: clean.
2026-05-13	Positive-coverage round 30 (helix-bridge + account-deactivation)	Round 29: schema-fidelity static probes for the read- — every entry must have id/name/status/type popula /llm/models — every entry must have id/provider AI zero context length, which would mislead callers con available-count must be 0 (matches /memory/stats.sy MEM-BLUFF cross-endpoint guard). All clean. Probe subpath isn't registered; the single /providers/:id helix-qa expanded 127 → 130 evidence files: HCQA-0

Date	Updater	What changed
2026-05-13	Positive-coverage round 28 (robustness)	of-file static-checks block (run early, in deterministic order, crossed the 100-counted-checks milestone). <code>run_all_challenges</code>: clean. Round 28: probed concurrent requests (20 parallel PIDs, no duplicate-id collisions), large payloads (1 MiB description body shapes (empty <code>{}</code> for required-field endpoint → <code>{}></code>), Pagination is a feature gap, not a bluff: <code>GET /tasks/</code> ignore the limit (return ALL 315 tasks / 300 workers), endpoint never claimed pagination support; the limit is documented for future product work. <code>helix-qa expansion-validation-400</code> for empty body), HCQA-093 (1MB-payload bearer-401). <code>helix-qa</code>: 98/98 PASS (127 evidence files). <code>secrets.sh</code>: clean.
2026-05-13	Production-bug sweep round 27	Round 27 probed auth/register input validation (overloaded correctly 400 — auth path is clean), then swept malformed more bug: (32) <code>GET /workers/<malformed>/metrics/</code> respondInvalidID branch. Fixed. Also: SQL-injection (<code>\"; DROP TABLE workers; --\"</code>) — <code>pgx</code> prepared statement data, the workers table survived intact. Positive-coverage regression to string-concatenated SQL. <code>helix-qa expansion-validation-metrics-malformed-400</code>), HCQA-090 (register-overloaded CREATE + HCQA-091 (SQL-injection defense — workload DROP TABLE; uses per-run unique hostname to avoid collision). 95/95 PASS (124 evidence files). <code>run_all_challenges</code>: <code>scripts/scan-secrets.sh</code>: clean.
2026-05-13	Production-bug sweep round 26	Round 26 found 3 more bugs in sessions + workers in <code>project_id</code> (well-formed UUID but no such project) in existent projects. Root cause: in-memory session manager declares. Fix: <code>createSession</code> handler now validates the <code>projectManager.getProject(req.ProjectID)</code> BEFORE <code>ErrProjectNotFound</code> for missing project. (30) Same as a-uuid”) — session created with non-UUID project id respondInvalidID for malformed UUIDs → 400). (31) returned 500 leaking pg <code>SQLSTATE 22001</code> “value too large for schema leakage (column type visible) + <code>CONST-035</code> worker.ErrWorkerHostnameTooLong sentinel + host RegisterWorker pre-validates BEFORE the INSERT; expanded 117 → 120 evidence files: HCQA-086 (session malformed-project_id→400), HCQA-088 (worker-overloaded “SQLSTATE”/“22001”/“character varying”). <code>helix-qa</code>: <code>run_all_challenges</code>: 12/12 PASS. go test -short server clean.
2026-05-13	Production-bug sweep round 25 (mandate re-asserted 3rd time)	Operator re-asserted the anti-bluff mandate verbatim in cascade (0 failures) + anchor in all 6 root docs. Round more real bug — (28) <code>PUT /projects/<malformed-uuid></code> returned HTTP 500 leaking raw postgres “invalid input (SQLSTATE 22P02)”. Same <code>CONST-042</code> + <code>CONST-035</code> UpdateProject and DeleteProject in <code>manager_db.go</code> p postgres without UUID validation; pg rejected with t <code>uuid.Parse(projectID); err != nil { return ..</code>

Date	Updater	What changed
2026-05-13	BUG #27 fix generalized — round 24	top of both functions. Also wired 4 additional handlers: updateProject, deleteProject, createTaskCheckpoint, found 404 path. Existing unit test TestDatabaseManager via assert.ErrorIs(err, ErrInvalidProjectID) — and expected the generic “failed to delete project” with the sentinel and confirms no DB call is made for malformed evidence files: HCQA-081 + HCQA-082 (project PUT, “SQLSTATE”/“22P02”/“fkey”), HCQA-083 + HCQA-084 (PUT-on-bogus 404). helix-qa: 89/89 PASS (117 evidence files). run_all_challenges: 12/12 PASS. go test -short server+project+session: ok. scripts/scan-secrets.sh: clean. Round 24 extended the round-23 fix (task.ErrInvalidProjectID wired) across the full handler matrix. Added worker.project.ErrInvalidProjectID, project.ErrInvalidProjectID (project unstructured invalid-id returns); fixed the cross-parameter inside task’s manager — wrapped with the handlers). Extended respondInvalidID to a switch case (failTask, startTask, completeTask, assignTask, retryTask, workerHeartbeat) to call respondInvalidID before failing endpoints that previously 500’d on malformed UUIDs. Evidence files: HCQA-074..080 (matrix coverage across update/heartbeat malformed-UUID-400). helix-qa: 84/84 PASS. go test -short server+task+worker+project: ok. secrets.sh: clean. Operator re-asserted the anti-bluff mandate verbatim in the cascade requirement. Re-confirmed: verify-governance-owned + listed third-party submodule; CONST-035 / governance docs (CONSTITUTION.md / CLAUDE.md). GET /tasks/ (correctly 401), duplicate-email (correctly 401), GET /tasks/ (correctly 404 via getTask’s generic returned HTTP 500 with “invalid task ID: invalid UUID”). malformed UUID is CLIENT input error, should be 400. task-manager call sites that do uuid.Parse(id). Introduced unstructured returns replaced via sed across manager.respondInvalidID(c, err, what) writes 400 when (canonical pattern in place for the remaining 7 task-id). helix-qa expanded 104 → 105 evidence files: HCQA-073 (D (105 evidence files). run_all_challenges: 12/12 PASS. secrets.sh: clean. Round 22 probed duplicate-create + workflow endpoints. Found 2 more bugs: (25) duplicate-hostname worker “workers_hostname_unique” (SQLSTATE 23505). Fix: isUniqueViolation(err) helper that parses pgconn translates pg unique-violations BEFORE leaking; handles projects/<bogus>/workflows/* returned 500 with introduced project.ErrProjectNotFound sentinel (7 manager.go + manager_db.go); 4 workflow handlers (action) helper. Bonus fix: the 3 non-planning workflows (fresh empty in-memory manager) instead of s.projectManager. Now all 4 use s.projectManager. helix-qa expanded W + HCQA-071 (dup-hostname-409-no-leak with expected “workers_hostname_unique”/“SQLSTATE”/“duplicate
2026-05-13	Production-bug sweep round 23 (operator re-asserted mandate)	Operator re-asserted the anti-bluff mandate verbatim in the cascade requirement. Re-confirmed: verify-governance-owned + listed third-party submodule; CONST-035 / governance docs (CONSTITUTION.md / CLAUDE.md). GET /tasks/ (correctly 401), duplicate-email (correctly 401), GET /tasks/ (correctly 404 via getTask’s generic returned HTTP 500 with “invalid task ID: invalid UUID”). malformed UUID is CLIENT input error, should be 400. task-manager call sites that do uuid.Parse(id). Introduced unstructured returns replaced via sed across manager.respondInvalidID(c, err, what) writes 400 when (canonical pattern in place for the remaining 7 task-id). helix-qa expanded 104 → 105 evidence files: HCQA-073 (D (105 evidence files). run_all_challenges: 12/12 PASS. secrets.sh: clean. Round 22 probed duplicate-create + workflow endpoints. Found 2 more bugs: (25) duplicate-hostname worker “workers_hostname_unique” (SQLSTATE 23505). Fix: isUniqueViolation(err) helper that parses pgconn translates pg unique-violations BEFORE leaking; handles projects/<bogus>/workflows/* returned 500 with introduced project.ErrProjectNotFound sentinel (7 manager.go + manager_db.go); 4 workflow handlers (action) helper. 2026-05-13	Production-bug sweep round 9	unreachable for the entire deployment. Fixed by mirroring RETURNING workspace_path + config, then extracting config["metadata"] in Go. helix-qa expanded 41 → 42: HCQA-040 (PUT renames + asserts new name/description) (DELETE 200), HCQA-041 (GET-deleted 404). helix-qa: 39/39 PASS. run_all_challenges: 12/12 PASS. go test -short server+task: ok. Round 9 uncovered 1 deep bluff in the memory subsystem: 6 systems all hardcoded as status: "available" while systems_connected: 0 — direct contradiction. Reading pure hardcoded English/metadata with NO connections to memory manager bound for any of the 6 listed providers (Zep). CONST-035 violation: handler claims "available" while endpoint correctly reports zero connections. Fix: introduce "not_configured" until a real manager is bound + a manager returns "not_configured" for all 6 (matches stats). The featureset remains as the documented set of supported features claim. helix-qa expanded 40 → 41: new "HCQA-MEMORY status="available" until real backing exists (any future manager-wiring will fail this check). helix-qa: 39/39 PASS. go test -short server+task: ok. scripts/scan-second: ok.
2026-05-13	Production-bug sweep round 8	Round 8 uncovered 2 more real bugs by extending helix-qa tasks/:id/checkpoints returned "checkpoints": slice→null JSON contract bluff (tasks, projects, workspace) []map[string]interface{}{} in getTaskCheckpoints. HTTP 500 "task not found, not in failed state, or max_retries exceeded" server-error code that lies about the nature of the problem (client-side state mismatch, not an internal bug). Introduced task.ErrTaskNotRetryable in internal/task/manager. returns 422 Unprocessable Entity for the state error. helix-qa expanded 35 → 40 evidence files (HCQA-036 task-create-for-life probe, retry-422, plus 2 internal-step probes HCQA-038-PR1, HCQA-038-PR2). 38/38 PASS (40 evidence files; the 2 internal-step probes count). run_all_challenges: 12/12 PASS. go test -short server+task: ok.
2026-05-13	Sessions-create probe addition (round 7)	Coverage expansion: probed POST /api/v1/session (from the round-4 HCQA-031 create-project probe) + sessions POST, asserts 201 + session.project_id returned. (no bug surfaced — Mode validation correctly rejects planning/building/testing/refactoring/debugging/deploying session.go). New HCQA-035 probe stitches the just-created sessions POST, asserts 201 + session.project_id returned. 35/35 PASS. run_all_challenges: 12/12 PASS.
2026-05-13	Production-bug sweep round 6	Round 6 uncovered 1 more real bug, same pattern as round 5: refresh returned HTTP 401 "User not authenticated" with Bearer token. Root cause: refreshToken handler called NO authMiddleware (must stay public for register/login). Authorization header via VerifyJWTWithDB, mirroring path returns a freshly-issued JWT (200) for valid Bearer token, missing header, 401 with "Invalid or expired token" for TestRefreshToken_WithUserContext unit test updated. c.Get("user") path no longer exists; mockDB-unverified for the unit test). helix-qa expanded 32 → 34: HCQA-032 (refresh returns 401 with Bearer token), HCQA-033 (refresh returns 401 with "Invalid or expired token") (DELETE 200), HCQA-034 (refresh returns 401 with "Invalid or expired token"). helix-qa: 39/39 PASS. run_all_challenges: 12/12 PASS. go test -short server+task: ok.

Date	Updater	What changed
2026-05-13	Production-bug sweep round 5	“valid JWT” rather than “different JWT” because iat is byte-identical tokens), HCQA-034 (garbage Bearer re run_all_challenges: 12/12 PASS. go test -short server Round 5 uncovered 1 more real bug, same pattern as returned HTTP 500 with ssh_config NOT NULL con optional ssh_config map. Same fix as task_data: wo nil sshConfig to map[string]interface{}{} and nil TEXT[] NOT NULL — pgx serializes nil slice as NULL the INSERT explicitly provides the value). helix-qa ex with empty body and asserts 201 + UUID + hostname run_all_challenges: 12/12 PASS. go test -short server Round 4 uncovered 2 more real bugs: (8) POST /api, ID: invalid UUID length: 12” — internal/project/m m.CreateProjectWithUser(..., "default-user") “default-user” is exactly 12 chars, matching the erro *auth.User from context and calls CreateProjectWi same POST route was registered under a publicPro testing — any unauthenticated caller could create p building/testing/refactoring) against any projectId. T the createProject handler unreachable (it now requir authMiddleware). Consolidated under the authentica entirely. helix-qa expanded 29 → 31: HCQA-030 (unau (authenticated POST /projects creates project with U TestCreateProject_ValidRequest updated to accep TestListProjects pattern). helix-qa: 31/31 PASS. ru internal/server/...: ok. scripts/scan-secrets.sh: clean. close-out¹³¹ — rounds 191-305 catch-up (constitution cascade + helix_code/internal i18n + per-repo deep-doc + PAN-001 fix)

Date: 2026-05-19 **Last commit at close-out time:** 2d95892 (gov: round-304 — bump challenges pointer) **Theme:** Single batched CONST-044 catch-up narrative for ~115 rounds executed since close-out¹³⁰ (round 192). Per CONST-044 (Continuation Document Maintenance Mandate) the documentation drift across rounds 191-305 is itself a CRITICAL DEFECT of equivalent severity to a CONST-035 false-success result; this close-out remediates that drift in a single condensed entry. Per-round narration cadence resumes next round.

Verbatim 2026-05-19 operator mandate (preserved per CONST-049 §11.4.17): *“all existing tests and Challenges do work in anti-bluff*

manner - they MUST confirm that all tested codebase really works as expected! We had been in position that all tests do execute with success and all Challenges as well, but in reality the most of the features does not work and can't be used! This MUST NOT be the case and execution of tests and Challenges MUST guarantee the quality, the completion and full usability by end users of the product!"

Constitutional anchor: HelixConstitution submodule (constitution/Constitution.md + constitution/CLAUDE.md + constitution/AGENTS.md) is the **canonical root** per CONST-059. This catch-up narrative extends the consumer-side docs/CONTINUATION.md and does NOT modify any canonical-root file.

What happened (thematic, not per-round)

1. **Constitution cascade rounds** — rounds 191 / 207 / 227 landed constitution-submodule §11.4.41-66 anchors as CONST-054 through CONST-067 (per CONST-049 fetch-before-edit pipeline + CONST-047 recursive submodule application). All anchors cascaded verbatim or by ID-reference into every owned-submodule CONSTITUTION.md / CLAUDE.md / AGENTS.md across vasic-digital + HelixDevelopment orgs. Verifier scripts/verify-governance-cascade.sh GREEN at each round's close.
2. **helix_code/internal i18n migration completed** — rounds 220-241 covered all 60+ packages of helix_code/internal/ per CONST-046 (no hardcoded user-facing content). Each migrated package shipped:
(a) i18n/ resource bundles in 5 locales (en, sr, ja, es, de — fixture set),
(b) i18n.Get(locale, key) call-sites replacing static literals, (c) audit-gate scripts/lint-hardcoded-strings.sh exit 0 across whole tree at round-241 close. Packages with no user-facing strings (pure internal infra) received NO-OP marker comments. helix_code/cmd subtree + LLMsVerifier deferred to HXC-003 backlog.
3. **Per-repo deep-doc enrichment** — rounds 242-305 applied the enrichment template across 52 vasic-digital + 9 HelixDevelopment + 5 top-level submodules (~65 enrichment rounds). Per-repo template (Template C): README ~150-210 LOC (purpose + architecture + quickstart + capability matrix + Challenges section + governance pointer), docs/test-coverage.md (per-package coverage matrix + Challenge wire-evidence pointers), challenges/runner/main.go (binary that executes the bank), challenges/
*_describe_challenge.sh paired-mutation scripts (assertion + intentional-mutation revert proving the assertion would fail without the fix), 5-locale fixture set under challenges/fixtures/i18n/. Pushed per-submodule across all configured upstream remotes per CONST-056.
4. **Real production bugs discovered + fixed during enrichment:**
 - **PAN-001** (round 298 discovery, round 302 fix): vasic-digital/ Panoptic UTF-8 truncation bug — truncateAt(s, n) sliced at byte

- offset n splitting multi-byte runes mid-codepoint (Cyrillic/CJK fixtures rendered as mojibake). Fix: rune-aware truncation via `[]rune(s)[:n] + size budget`. Paired-mutation Challenge `truncation_describe_challenge.sh` proves it.
 - **Veritas stale CLAUDE.md** (round 288 discovery): documents removed RemoveSource API. Deferred — not blocking.
 - **LLMOps structural-bluff Challenge** (round 290): existing Challenge asserted on file-presence (`grep`), replaced with exit-code-driven `go test` invocation per the round-40 phase-challenge tightening pattern.
5. **Submodule deduplication finding** (round 277): `HelixDevelopment/Models` and `vasic-digital/Models` point at the same upstream repo. Documented; no consolidation work this round.
 6. **Sibling-session commit-message race pattern** (rounds 228-285): repeated non-FF rejections on submodule pushes because sibling subagent sessions had landed concurrent commits. Mitigation per CONST-043 (no force-push, no `--force-with-lease` without explicit per-operation approval): `fetch + rebase` or `re-apply` onto upstream tip + `re-push`. Pattern documented in close-out narrative.

What's still open (rolled forward into the live backlog)

- **VEN-002, HXA-002, HXQ-001** — still BLOCKED on operator decisions
- **HXC-001** — In progress (round 343). Operator approved “agent defaults” for all 12 decisions; round 343 executed 3 build-verified batches renaming 13 owned-org leaf submodule dirs to `snake_case`: `HelixDevelopment/{Models→models, DebateOrchestrator→debate_orchestrator}` + 11 `vasic-digital/*zero-go.mod-consumer` leaves (`auto_temp`, `claritas`, `doc_processor`, `gandalf_solutions`, `hyper_tune`, `i_llm`, `leak_hub`, `ouroborous`, `plinius_common`, `veritas`, `vision_engine`). Deferred (submodule-`go.mod-entanglement / parent-dir / cluster-C`): ~37 remaining owned-org leaves consumed by `helix_agent/helix_qa/HelixLLM go.mod`, parent dirs `HelixDevelopment/→helix_development/ + vasic-digital/` kept (GitHub-org handle), 59 `Upstreams/→upstreams/` dirs inside submodule trees. Each deferred batch needs dedicated per-submodule rounds to avoid entangling pre-existing uncommitted work.
- **HXC-003** CONST-046 migration backlog — `helix_code/internal` COMPLETE; remaining pending: `LLMsVerifier` ~1804 strings + `cmd/helix_config` ~241 strings + `cmd/cli` ~7 strings
- **Veritas CLAUDE.md** stale RemoveSource reference — deferred from round 288
- **Nested third-party submodule pointer drift** in `helix_qa/tools/opensource/*` — deferred per CONST-051(C) (third-party submodules exempt from own-org dependency-layout rules)

Next

- Resume per-round narration cadence (CONST-044 compliance)

- HXC-003 remaining CONST-046 migrations (LLMsVerifier is the biggest single chunk)
- Cascade detection follow-up for any newly-pulled constitution anchors (CONST-055 sweep on next constitution-submodule pull)
- Operator-blocked item triage (VEN-002 / HXA-002 / HXQ-001 / HXC-001)

Posture

- **Constitutional posture:** CONST-035 anti-bluff + CONST-044 continuation-maintenance + CONST-046 i18n + CONST-047 recursive-submodule-application + CONST-049 verbatim-mandate-preservation + CONST-050(A) no-fakes-beyond-unit-tests + CONST-051(B/C) decoupling + dependency-layout + CONST-052 snake_case + CONST-053 .gitignore-hygiene + CONST-055 post-pull-validation + CONST-056 install_upstreams-on-clone + CONST-057 Type-aware closure vocab + CONST-058 reopened-source-attribution + CONST-059 canonical-root inheritance + CONST-060 fetch-before-edit all honoured per-round. This close-out¹³¹ remediates the CONST-044 drift across rounds 191-305 in a single batched narrative; per-round cadence resumes next round.

close-out¹³² — round 398: Speed Programme launch + constitution §11.4.68/70-74 cascade + mirror reconciliation

Date: 2026-05-20 **Theme:** Three concurrent working points active this session, recorded per CONST-044 in the same commit that advances state (operator docs-sync mandate: *“Keep Issues and relevant documentation up to date and in sync ... All working points we are doing MUST BE there as well!”*).

Working points (filed into the live backlog as Issues)

1. **HXC-006 — HelixCode Speed Programme** (Feature, In progress). Operator mandate (2026-05-20) to make all HelixCode + owned-submodule code 3-5x faster than competitor AI CLI agents without breaking features or weakening anti-bluff posture. Research corpus complete under docs/research/speed/ (5 docs — bottleneck audit, competitive analysis, optimization techniques, overview, 6-phase / 31-task phased plan). **Phase 0 (measurement baseline) execution started** — establishing reproducible per-operation latency/throughput baselines so every later speed-up carries before/after captured evidence per CONST-035.
2. **HXC-007 — Constitution §11.4.68/70-74 cascade** (Task, In progress). Constitution submodule fetched + pulled first per CONST-049 (584b3ee → 34a82b3); 6 new rules cascaded verbatim/by-ID into meta-repo governance files + 67 owned submodules per

CONST-047; meta .gitmodules constitution pointer bumped. Stays open until the CONST-049 step-4 multi-upstream reconciliation converges all mirrors.

3. **HXC-008 — CONST-055 G1 governance gaps** (Bug, In progress). Post-constitution-pull validation sweep surfaced two **pre-existing** (not regression) gaps: (a) scripts/verify-all-constitution-rules.sh references a non-existent dependencies/HelixDevelopment/Models path — actual dirs are lowercase models + vasic-digital/Models; (b) helix_qa/CONSTITUTION.md missing CONST-047..057, VisionEngine/CONSTITUTION.md missing §11.4.69.
4. **HXC-009 — Owned-submodule mirror-divergence reconciliation** (Task, In progress). Systemic divergence between vasic-digital ↔ HelixDevelopment GitHub/GitLab mirrors of several owned submodules. helix_qa reconciled via merge-first commit a0397a4; VisionEngine, LLMPProvider, others under reconciliation per CONST-061 / §11.4.71 merge-first — NO force-push, NO history rewrite.

State

- 4 new Issues filed (HXC-006/007/008/009); none closed this session; Issues_Summary.md regenerated — 6 open (1 Bug, 3 Task, 2 Feature, 0 BLOCKED).
- Tracker HTML+PDF exports regenerated for all touched docs per §11.4.12/53/60/65.
- No production code touched in this docs-sync commit; submodule pointer changes from parallel sessions deliberately NOT staged (parallel sessions share the meta worktree).

Next

- HXC-006 Phase 0 baseline capture → Phase 1 of the speed phased plan.
- HXC-009 reconcile remaining divergent owned-submodule mirrors (VisionEngine, LLMPProvider).
- HXC-008 fix the verifier path reference + cascade the missing CONST-047..057 / §11.4.69 anchors; re-run verify-all-constitution-rules.sh G1.

close-out¹³³ — CodeGraph incorporation Phase D (CG14-CG16)

Date: 2026-05-20 **Theme:** CodeGraph (MCP code-graph server) incorporation Phase D — governance covenant sync + documentation + CONST-047 recursive sweep. Phases A+B (install, scan, five-agent registration) already landed; this close-out completes the governance/docs phase per docs/research/codegraph/incorporation-plan.md §6.

Work performed

1. **CG14 — anti-bluff covenant gap fix.** Dified root QWEN.md and CRUSH.md against the current CLAUDE.md/AGENTS.md CONST-0xx anchor set. Both were stale (last modified 2026-05-16, before the 2026-05-20 CLAUDE.md/AGENTS.md revisions): each carried CONST-035..059 but was **missing CONST-060 (Fetch-before-edit, §11.4.37) and the §11.4.68/70-74 anchor block** (Positive Sink-Side Evidence, Subagent-Driven-Default, Pre-Push Fetch+Investigate, Audio Top-Priority, Main-Spec Versioning, Submodule-Catalogue-First). Appended all six anchors verbatim from the canonical CLAUDE.md text to both files. Classification: universal (per §11.4.17) — consumer-side extension files mirroring the project-level anchors.
2. **CG15 — documentation.** Updated tools/codegraph/README.md (Revision 2) — added per-agent registration section with the cross-agent config table and the Catalogue-Check: no-match 2026-05-20 metadata line (§11.4.74 — CodeGraph is third-party, not in the vasic-digital/HelixDevelopment catalogue). Added a CodeGraph integration section to docs/COMPLETE_CLI_REFERENCE.md (install/init/scan/per-agent registration) and removed a stray closing-tag artefact at the end of that file. This close-out note added per CONST-044.
3. **CG16 — CONST-047 recursive sweep.** Ran scripts/verify-governance-cascade.sh — **2 failures, both pre-existing and already tracked as HXC-008:** (a) dependencies/HelixDevelopment/Models verifier path-list entry out of sync with on-disk lowercase models dir; (b) helix_qa/CONSTITUTION.md missing CONST-047..057. Neither failure is caused by the QWEN.md/CRUSH.md/codegraph Phase-D changes — the covenant-sync edits introduce no new cascade gap. Owned-submodule CodeGraph-config assessment: no owned submodule (helix_qa, challenges, containers, security) currently warrants its own CodeGraph MCP wiring — the meta-repo + inner helix_code/ graphs already cover the first-party Go code the agents query; a per-submodule graph would add maintenance cost for marginal benefit. Recorded as assessed-no-follow-up; revisit if a submodule grows a substantial standalone codebase queried independently.

State

- QWEN.md + CRUSH.md now carry the complete CONST-035..060 + §11.4.68/70-74 anti-bluff covenant — fully in sync with CLAUDE.md/AGENTS.md.
- tools/codegraph/README.md Revision 2; docs/COMPLETE_CLI_REFERENCE.md gains a CodeGraph section.
- Cascade verifier: 2 pre-existing failures (HXC-008) unchanged — Phase D introduced no regression.
- HTML+PDF exports regenerated for touched docs per §11.4.65.

Next

- HXC-008 remains the path to clearing the 2 cascade-verifier failures.
 - CodeGraph Phase C anti-bluff Challenges (CG10-CG13) remain the outstanding incorporation work if not yet landed by a sibling session.
-

close-out¹³⁴ — CodeGraph incorporation Phase C (CG10-CG13)

Date: 2026-05-20 **Theme:** CodeGraph (MCP code-graph server) incorporation Phase C — anti-bluff verification per docs/research/codegraph/incorporation-plan.md §5 + §6. Proves CodeGraph genuinely works end-to-end on the real HelixCode repo and reaches all five CLI agents (CONST-035 / Article XI §11.9).

Work performed

1. **CG10 — Layer A.** Replaced the tools/codegraph/verify.sh stub with the real end-to-end proof: codegraph status (asserts non-zero files/nodes/edges — 39 022 / 624 092 / 1 644 454 captured), codegraph query Provider (asserts real Go symbols), codegraph context (asserts real repo files), plus an anti-bluff token guard. Wrapped as Challenge CG-CHALLENGE-01. **PASS** — evidence docs/research/codegraph/evidence/phase-c/cg-challenge-01-.*.
2. **CG11 — Layer B.** Challenge CG-CHALLENGE-02 drives codegraph serve --mcp over stdio with real JSON-RPC: initialize → serverInfo, tools/list → 9 codegraph_* tools, tools/call codegraph_search → real graph data. JSON-RPC wire transcript captured (cg-challenge-02-jsonrpc-wire.jsonl). **PASS**.
3. **CG12 — Layer C.** Challenges CG-CHALLENGE-03..07, one per agent, with a shared lib-agent-challenge.sh driver: tier-1 drives the agent CLI non-interactively and asserts a real .go symbol path; tier-2 (§11.4.3 topology dispatch) falls back HONESTLY to connect-only + tool-discovery proof when an agent cannot be driven to a real answer. **Results:** Claude Code (primary) — **true end-to-end PASS**; OpenCode — true end-to-end PASS; Crush — true end-to-end PASS; Kimi CLI — connect-only PASS (LLM monthly-quota 429 blocked the answer; its MCP loader did enumerate all 9 codegraph tools); Qwen Code — connect-only PASS (bundled OAuth free tier discontinued upstream 2026-04-15). 3/5 agents true end-to-end, 2/5 connect-only — reported honestly, no false end-to-end claims.
4. **CG13 — helix_qa bank.** Registered the 7 Challenges as a helix_qa test bank tools/codegraph/challenges/codegraph-integration.bank.yaml. Per CONST-051(B) the bank lives in the HelixCode tree — NOT inside the project-not-aware helix_qa submodule (the bank hardcodes HelixCode Challenge paths, which would couple the reusable submodule to HelixCode). The helix_qa runner accepts

arbitrary bank paths via `-banks`, so it is fully consumable:
`helixqa run -banks tools/codegraph/challenges/codegraph-integration.bank.yaml`. Runner `tools/codegraph/challenges/run-all.sh` executes all 7 with per-Challenge captured evidence.

State

- 7 Challenges under `tools/codegraph/challenges/` — all bash `-n-clean` with §11.4.18 doc blocks; bank run **7/7 PASS** after the CG-CHALLENGE-03 arg-shift fix.
- `tools/codegraph/verify.sh` is now a real anti-bluff proof (no longer a stub).
- All runtime evidence under `docs/research/codegraph/evidence/phase-c/` — status JSON, query JSON, JSON-RPC wire transcript, 5 agent transcripts, per-Challenge run logs.
- `helix_qa` autonomous-session integration: bank registered + discoverable; direct execution via `run-all.sh` captures per-check evidence. Full autonomous-session orchestration left to a `helix_qa QA run`.

Next

- CodeGraph Phase D (CG14-CG16) already landed (close-out¹³³).
- A `helix_qa` autonomous QA session may execute the `codegraph-integration` bank for orchestrated per-check evidence capture.

close-out¹³⁵ — HelixCode Speed Programme COMPLETE (P5-T04 — all 6 phases / 31 tasks landed)

Date: 2026-05-20 **Theme:** Speed-programme final task P5-T04 — CONST-048 coverage ledger, release-gate sweep, and programme close-out. Closes **HXC-006** (HelixCode Speed Programme, Feature). Operator mandate 2026-05-20: make HelixCode + owned-submodule code 3-5× faster than competitor AI CLI agents without breaking any feature or weakening anti-bluff posture.

Verbatim 2026-05-19 operator mandate (preserved per CONST-049 §11.4.17): *“all existing tests and Challenges do work in anti-bluff manner - they MUST confirm that all tested codebase really works as expected! We had been in position that all tests do execute with success and all Challenges as well, but in reality the most of the features does not work and can't be used! This MUST NOT be the case and execution of tests and Challenges MUST guarantee the quality, the completion and full usability by end users of the product!”*

Work performed (P5-T04)

1. **CONST-048 coverage ledger.** Created docs/research/speed/05-coverage-ledger.md (constitution §11.4.44 metadata header) — one row per task P0-T01..P5-T04 (mapped to opportunities O1-O21), each carrying the commit SHA, the captured before→after measurement, and the six CONST-048 invariants ([AB][WC][MD][NB][DS][TF]). Roll-up: **29 PASS + 2 PARTIAL + 0 DEFERRED** across all 31 tasks.
2. **Release-gate sweep.** scripts/audit-const046-hardcoded-content.sh ran exit 0 (speed work added no user-facing strings — no new hardcoded content). scripts/verify-governance-cascade.sh reported 2 failures = the already-tracked **HXC-008** pre-existing drift (stale Models path + helix_qa/CONSTITUTION.md missing CONST-047..057), NOT speed-programme regressions. Anti-bluff smoke grep -rn "simulated\|for now\|TODO implement\|placeholder" helix_code/internal helix_code/cmd (prod, non_test.go) = clean. make verify-compile not re-run (P5-T04 is docs-only; compile state unchanged from 98315a14).
3. **Two deferred findings filed** per §11.4.15/16: **HXC-011** (Bug — helix_qa runner emits hollow sub-µs PASSED metadata rows for desktop-platform bank cases without executing them — a §11.4 PASS-bluff in the QA runner) and **HXC-012** (Bug — data race in helix_code/internal/llm/load_balancer.go stat-collector goroutine under full-package -race). Both pre-existing; surfaced during the speed programme; reported honestly.
4. **HXC-006 closed.** All 31 tasks genuinely landed → HXC-006 updated to Implemented (→ Fixed.md) per CONST-057/§11.4.33 and migrated to docs/Fixed.md per §11.4.19. Issues_Summary.md + Fixed_Summary.md regenerated; HTML/PDF exports refreshed.

Speed-programme outcome

All 6 phases / 31 tasks landed across rounds — P0 (baseline harness), P1 (LLM & startup wins), P2 (context-build speed), P3 (interactive & agent-loop levers), P4 (profile-gated tuning), P5 (dev-experience + submodule cascade + close-out). Headline measured wins (each with pasted in-session evidence per CONST-035): lazy Ollama discovery 67µs→2.7ns, lazy CLI startup ~8.85×, cache pre-warm ~7.6×, regexp hoist ~7.4×, repo-map cache ~10.6× warm, parallel search ~4.39×, incremental tree-sitter ~21×, small-model routing ~5.87×, diff edits 94-99% token cut, fast-apply ~516×, tool parallelism ~5.99×, PGO -46% CPU-bound.

Honest PARTIALs (no green PASS claimed): P5-T01 build/test parallelism tuning is landed and correct but the suite-wall-time before/after delta was not captured as a pasted benchmark; P5-T02 is a partial single-provider internal/llm split (Cerebras extracted to internal/llm/providers/cerebras/) — a full 18-provider extraction is infeasible without an import cycle.

State

- docs/research/speed/05-coverage-ledger.md committed (+ HTML/PDF exports).
- HXC-006 closed in docs/Issues.md (migration tombstone) → full record in docs/Fixed.md.
- HXC-011 + HXC-012 filed Queued in docs/Issues.md.
- Issues_Summary.md / Fixed_Summary.md regenerated; tracker exports refreshed.

Next

- HXC-011 (helix_qa desktop-platform hollow-PASS) closed round 402 — Fixed (→ Fixed.md): the runner's run path on the desktop platform now genuinely executes a bank case's shell: action via os/exec and scores PASS/FAIL on the real exit code (reproduce-before-fix RED→GREEN; helix_qa commit 6b46df0, meta pointer bumped).
 - HXC-012 (load_balancer.go race) closed round 401. Both pre-existing speed-programme findings now resolved.
 - The speed programme is complete; no further speed tasks queued.
-

close-out¹³⁶ — round 403: HXC-008 governance-gap fix + HXC-007/HXC-009 verified-complete closure

What landed

1. **HXC-008 closed Fixed (→ Fixed.md)** (Bug). The two pre-existing CONST-055 G1 cascade-drift gaps surfaced in close-out¹³² / CG16 are fixed:
 - 1. docs/improvements/submodule_owned.txt line 10 referenced dependencies/HelixDevelopment/Models — a path that does not exist on disk; the CONST-052 batch-1 rename (alea3c8) had lowercased it to models (.gitmodules registers it lowercase). Corrected to dependencies/HelixDevelopment/models. The cascade verifier (scripts/verify-governance-cascade.sh) reads this file, so the false FAIL: dependencies/HelixDevelopment/Models — path does not exist on disk line is now gone.
 - 1. helix_qa/CONSTITUTION.md was missing anchors CONST-047..057 (CLAUDE.md/AGENTS.md already carried them); VisionEngine/CONSTITUTION.md was missing §11.4.69 (likewise). The contiguous CONST-047..057 block (217 lines) was cascaded into helix_qa/CONSTITUTION.md from the meta CONSTITUTION.md; the §11.4.69 anchor (80 lines) into VisionEngine/CONSTITUTION.md. Both submodules committed + pushed to all upstreams (helix_qa 1364d23;

- VisionEngine b3a13d8, integrating upstream docs commit bfe3b06 first per §11.4.71).
 - Verification: scripts/verify-governance-cascade.sh → === Result: 0 failures === PASS; scripts/verify-all-constitution-rules.sh → Gates run: 6 / Failures: 0 (G1-G6 all PASS).
- 2. **HXC-007 closed Completed (→ Fixed.md)** (Task). Constitution §11.4.68/70-74 cascade verified genuinely complete: meta .gitmodules constitution pointer confirmed at 34a82b3; spot-check grep -c "11.4.70\\|11.4.74"=6 across helix_qa, dependencies/HelixDevelopment/LLMProvider, challenges CLAUDE.md.
- 3. **HXC-009 closed Completed (→ Fixed.md)** (Task). Owned-submodule mirror-divergence reconciliation verified complete: VisionEngine carries convergence merge 3485f5f and pushes FF-clean to all 4 upstreams; helix_qa, LLMProvider, challenges, containers, DocProcessor all converged per CONST-061/§11.4.71 merge-first.

State

- All three items migrated to docs/Fixed.md per §11.4.19; docs/Issues.md sections retained as migration tombstones.
- docs/Issues_Summary.md + docs/Fixed_Summary.md updated (open count 6→3); all 8 tracker exports (4 HTML + 4 PDF) regenerated via scripts/regenerate-tracker-exports.sh.
- Meta-repo: verifier-input fix + tracker migrations + exports committed; helix_qa + VisionEngine meta pointers bumped.

Next

- No open Bug items remain. Open: HXC-001 (Task), HXC-003 (Feature), HXC-010 (Operator-blocked Task — CodeGraph end-to-end verification awaiting LLM-backend credentials).

close-out¹³⁷ — round 463: HXC-003 closed Implemented (→ Fixed.md) — CONST-046 i18n migration campaign concluded

What landed

1. **HXC-003 closed Implemented (→ Fixed.md)** (Type: Feature, per CONST-057/§11.4.33). The CONST-046 i18n migration campaign — the longest-running Feature in docs/Issues.md — is **concluded**. The genuine user-facing (C) string-literal surface (UI text, prompts shown to the operator, error messages surfaced to end users, labels, helper text) is **exhausted across all 7 CONST-046 scope areas**:
 - 1. helix_code internal/, (2) cmd/, (3) applications/ — confirmed exhausted rounds 461/462 (applications final-sweep × 110 literals at meta HEAD 72389451).

- 1. LLMsVerifier — round 452.
 - 1. helix_qa.
 - 1. all owned vasic-digital/* submodules + (7) all owned HelixDevelopment/* submodules — rounds 413/441.
2. **Scale + anti-bluff posture.** Across ~91-462 rounds, **tens of thousands of literals** were migrated through i18n seams — nicksnyder/go-i18n/v2 Bundle/Localizer (Option D, design f9dc102, pkg/i18n foundation e29b075) plus locale-aware .toml/.yaml resource files. **Every migration round shipped paired-mutation anti-bluff tests** (per §1.1): a known un-migrated literal is planted and the test asserts the audit-gate reports FAIL — so a PASS certifies real i18n coverage rather than absence-of-error. The audit-gate scripts/audit-const046-hardcoded-content.sh --fail-on-new is enforced; each round re-ran --update-baseline so the snapshot shrank monotonically.
 3. **Remaining audit hits are out of scope.** The ~55k audit-baseline hits that remain are **all OUT of CONST-046 scope** — (A) LLM prompt templates (strings addressed to a model, not a human), (B) wrapped-error developer-facing tech strings, identifier tokens, struct-tag keys, format-spec tokens, and test fixtures — classified file-by-file in docs/audits/2026-05-20-internal-const046-classification.md (Revision 2). CONST-046's invariant is satisfied: no user-facing text is hardcoded as a static literal; every such string is LLM-generated, i18n-loaded, or metadata-composed.

State

- HXC-003 migrated to docs/Fixed.md per §11.4.19; docs/Issues.md section retained as a migration tombstone.
- docs/Issues_Summary.md updated (open count 3→2; Feature open 1→0); docs/Fixed_Summary.md updated (Feature count 67→68; total closed 95→96; open snapshot 3→2).
- All 8 tracker exports (4 HTML + 4 PDF) regenerated via scripts/regenerate-tracker-exports.sh.

Next

- Open set is now exactly 2 items: **HXC-001** (CONST-052 rename programme — Task, In progress; ~37 submodule-entangled leaf renames + parent dirs + 59 Upstreams dirs deferred) and **HXC-010** (Kimi CLI + Qwen Code CodeGraph end-to-end verification — Operator-blocked Task; awaiting LLM-backend credentials). No open Bug or Feature items remain.
-

close-out¹³⁸ — round 464: HXC-010 closed Completed (→ Fixed.md) — Kimi/Qwen CodeGraph end-to-end verified with operator-provided credentials

Verbatim 2026-05-19 operator mandate (preserved per CONST-049 §11.4.17): *“all existing tests and Challenges do work in anti-bluff manner - they MUST confirm that all tested codebase really works as expected! We had been in position that all tests do execute with success and all Challenges as well, but in reality the most of the features does not work and can’t be used! This MUST NOT be the case and execution of tests and Challenges MUST guarantee the quality, the completion and full usability by end users of the product!”*

What landed

1. **HXC-010 closed Completed (→ Fixed.md)** (Type: Task, per CONST-057/§11.4.33). The operator supplied OpenAI-compatible router credentials (/home/milosvasic/api_keys.sh), unblocking the two CodeGraph per-agent Challenges that had been Operator-blocked since round 463.
2. **§11.4.10.A pre-use leak-audit: CLEAN.** git grep + git log -S of the three relevant key values (KIMI_API_KEY, OPENROUTER_API_KEY, SILICONFLOW_API_KEY) confirmed none has ever been committed to a tracked file or git history.
3. **The originally-blocking backends remain blocked.** KIMI_API_KEY shares the **same exhausted account-level monthly billing-cycle quota** as Kimi’s bundled OAuth (exceeded_current_quota_error on api.kimi.com/coding/v1); Qwen’s bundled OAuth free tier is still discontinued; OPENROUTER_API_KEY had insufficient credit (~\$0.0007). Resolution: both agents driven against the **SiliconFlow** OpenAI-compatible router, which has credit and serves both target models with working tool-calling.
4. **Kimi CLI** — driven via an openai_legacy-type provider (config-file ~/.kimi/config-codegraph-or.toml carrying only a placeholder api_key); the real key injected at runtime via the OPENAI_API_KEY env var (kimi_cli/llm.py augment_provider_with_env_vars), model moonshotai/Kimi-K2.6. **Qwen Code** — driven via --auth-type openai with OPENAI_API_KEY/OPENAI_BASE_URL/OPENAI_MODEL env vars (key NEVER written into the tracked .qwen/settings.json), model Qwen/Qwen3-Coder-30B-A3B-Instruct.
5. **Both Challenge scripts updated** (tools/codegraph/challenges/cg-challenge-05-kimi.sh + cg-challenge-07-qwen.sh) to honour HELIX_CG_OPENAI_API_KEY + HELIX_CG_OPENAI_BASE_URL (+ optional HELIX_CG_QWEN_MODEL) for the credentialed path, falling back to the bundled quota-gated provider when those env vars are absent — anti-bluff preserved (the connect-only fallback is still reported honestly when no creds are present).

6. **Result — both true tier-1 PASS.** `cg-challenge-05-kimi.sh` → CG-CHALLENGE-05: PASS (true end-to-end — agent invoked `codegraph_*` and returned real graph data); `cg-challenge-07-qwen.sh` → CG-CHALLENGE-07: PASS (true end-to-end ...). Each transcript shows the MCP loader connecting to the codegraph server (9 `codegraph_*` tools), the agent invoking `codegraph_search` for symbol Provider, the `ToolResult/tool_result` returning 10 real .go symbol paths from the scanned HelixCode graph (first: `docs/helix_qa/HelixQA_Integration/research/testdata/raw/pkg_llm_provider.go:40`), and the agent answering with a real file path.

State

- HXC-010 migrated to `docs/Fixed.md` per §11.4.19; `docs/Issues.md` section retained as a migration tombstone.
- Evidence captured under `docs/research/codegraph/evidence/hxc010/` (both transcripts + README); secret-scan of every transcript confirms **no API-key value present**.
- `docs/Issues_Summary.md` updated (open count 2→1; Operator-blocked Task 1→0); `docs/Fixed_Summary.md` updated (Task count 7→8; total closed 96→97; open snapshot 2→1).
- All 8 tracker exports (4 HTML + 4 PDF) regenerated via `scripts/regenerate-tracker-exports.sh`.
- All 7 CodeGraph anti-bluff Challenges (CG-CHALLENGE-01..07) now true-end-to-end verified across Claude Code, OpenCode, Crush, Kimi CLI, and Qwen Code.

Next

- Open set is now exactly 1 item: **HXC-001** (CONST-052 rename programme — Task, In progress). No open Bug, Feature, or Operator-blocked items remain.
