

RESUME

Session Resume — HelixLLM Full-Extension

Branch: feature/helixllm-full-extension | **HEAD:** bc1daffa (R41 convergence in progress — more commits landing) | **Date:** 2026-07-11 | **Tags:** helix-code-1.1.0-dev-0.0.1 @ dfa6a2c2 (current release) + helix-code-1.0.0-dev-0.0.1 @ 10c40c85

What is this

Machine-readable §11.4.131 session-resumption file. Fresh session: read this + .superpowers/sdd/progress.md (the full R1–R41 ledger), `git fetch --all`, then continue automatically.

Ground Truth (verify: `git log --oneline -12`, `podman ps -a`, `nvidia-smi`, `ls /dev/dri`)

- **HEAD:** root bc1daffa (branch == github == gitlab at 536ac9c6 before R41; R41 commits e461edc1 → bc1daffa are LOCAL, UNPUSHED).
- **Owned submodule gitlinks — all SAME as their HEADs** (helix_llm b05e56c0, llms_verifier 36b21b41, helix_qa 01b47308): NO owned-submodule pointer bump needed. **Constitution submodule ADVANCED to 79c9804f** (§11.4.182 hook/labeler) → root constitution gitlink bump OWED (push operator-gated).
- **CODER IS DOWN:** helixllm-coder won't boot — CDI pins stale /dev/dri/card0; host has card1+renderD128 (§11.4.111 re-enumerated Jul-9 reboot); `nvidia-ctk cdi list=0`, no CDI spec. GPU idle (32081 MiB free). **BOOT FIX (operator/root):** `sudo nvidia-ctk cdi generate --output=/etc/cdi/nvidia.yaml && podman start helixllm-coder`. All live-coder work blocked until then.
- **Foreign §11.4.174:** submodules/helix_agent (FOREIGN go.mod/go.sum/qa_bak — NEVER sweep) + /mnt/track1/ (ATMOSphere T1 project live-recording 3 adb devices 66ff9c4f.../93f4f1fd.../998fd36... — NEVER touch).

OPEN SECURITY INCIDENT (CONST-042)

Leaked Google GEMINI_API_KEY was committed+pushed (f994c0c2, in docs/qa/phase1_providers_20260708T141500Z/live_probe.md). **Redacted at HEAD (41372967)** + post-mortem (docs/qa/SECURITY_INCIDENT_gemini_key_leak_20260711.md). Value remains in pushed history (force-push forbidden §11.4.113) → **OPERATOR MUST ROTATE the key in Google Cloud** — that is the only complete remediation. Permanent secret-scan guard landing in the security-fix stream.

Phase — R41 convergence tail

(Extend → Finalize → Hold, plan docs/superpowers/plans/2026-07-11-helixllm-extend-finalize-hold.md)

Extend + finalize streams landed (all real-evidence, reviewed): §11.4.182 alias-label enforcement (hook+labeler+5-carrier+wired guard, reviewed GO); doc-integrity; governance sweep; fresh provider live-proofs; harness false-FAIL fix; QA-hygiene; provider §11.4.99 currency; §11.4.124 dead-code disposition; carrier-PDF regen; security redaction. IN FLIGHT: security-fix (I-1/I-2 §11.4.120 + secret-scan guard), catalogue-providers (HF+together), labeler env-var follow-up.

Next Actions

1. Drain in-flight streams (security-fix, catalogue-providers, labeler-envvar) + §11.4.142 review each.
2. WHOLE-BRANCH FINAL REVIEW (SDD end-gate, opus) over dfa6a2c2...HEAD (10 commits).
3. Constitution submodule gitlink bump (§11.4.98) — after §11.4.182+labeler settle.
4. Operator-gated: rotate key · coder-boot · constitution push · merge-to-main+prefixed tag (§11.4.151/§11.4.167) · API keys · cerebras removal (§11.4.122) · wire replicate provider (§11.4.124) · §11.4.185 manual QA final confirmation.

Binding Constraints

- ANTI-BLUFF §11.4: every PASS = captured physical evidence; no metadata-only, no self-certification.
- NO FORCE PUSH §11.4.113: merge-onto-latest-main, ff-only. Outward push operator-gated (github+gitlab; GitFlic/GitVerse not configured).

- HOST SAFETY §12 / §12.12 RLIMIT_NPROC. Every guard §1.1 paired-mutation-proven.
- LABELS §11.4.182: every agent/subagent/reference (T1/feature/helixllm-full-extension - claude3) (alias from CLAUDE_CONFIG_DIR=.claude-claude3); wired guard enforces it.
