

# Issues\_Summary

Open workable items (current\_location = Issues), regenerated from the SQLite single-source-of-truth (§11.4.12).

## Counts by Type × Status

| Type    | Status                   | Count |
|---------|--------------------------|-------|
| Bug     | Fixed (→ Fixed.md)       | 19    |
| Bug     | Queued                   | 2     |
| Feature | Implemented (→ Fixed.md) | 3     |
| Feature | Queued                   | 3     |
| Task    | Completed (→ Fixed.md)   | 18    |
| Task    | Fixed (→ Fixed.md)       | 1     |
| Task    | Queued                   | 5     |
| TOTAL   |                          | 51    |

## Items

| ATM ID  | Type    | Status                 | Severity | Description                                                                         |
|---------|---------|------------------------|----------|-------------------------------------------------------------------------------------|
| HXA-001 | Bug     | Fixed (→ Fixed.md)     | —        | helix_agent handler tests surface after round-109 fix                               |
| HXA-002 | Bug     | Fixed (→ Fixed.md)     | —        | helix_agent debate/llmprovider sibling-submodule API drift                          |
| HXA-003 | Bug     | Fixed (→ Fixed.md)     | —        | venice TestGetCapabilities mod drift (CONST-037)                                    |
| HXC-001 | Task    | Completed (→ Fixed.md) | —        | CONST-052 rename programme: repo directories still PascalCase - CLOSED (→ Fixed.md) |
| HXC-002 | Bug     | Fixed (→ Fixed.md)     | —        | Round-74 residual LOGIC-class F (CLOSED)                                            |
| HXC-003 | Feature |                        | High     |                                                                                     |

| ATM ID   | Type    | Status                         | Severity                                                                                                                 | Description                                                                                                                                                  |

| HXC-118 | Feature | Queued | High     | <p>A dedicated Retrieval-Augmented Generation component is maintained as its own reusable module, but the main application does not import or use it anywhere. A capability the product is expected to offer (answering using retrieved documents) is therefore effectively unavailable to end users despite code existing. The work integrating existing RAG module into the application, wires it into the request flow, and exposes its capability for users. Users gain working document-grounded answers instead of an orphaned, unused component.</p> |
| HXC-119 | Feature | Queued | High     | <p>Governance rule CONST-040 lists Agent Client Protocol among required capabilities, but there is no implementation of it anywhere in the codebase. Any user or integration expecting ACP connectivity currently cannot use it. The work is to design and implement real ACP support. If it proves structurally infeasible, document that with cited evidence. The platform will then either genuinely support ACP or hold a honest, evidenced position instead of an unmet claim.</p>                                                                     |
| HXC-122 | Task    | Queued | Medium   | <p>Two categories of tests, memory and end-to-end automation, skip some of their cases by default because they require a live server or special environment flags not set in normal runs. In practice these areas are largely unverified even though the tests appear to exist. The work provides a documented, repeatable way to run them against real</p>                                                                                                                                                                                                 |

|         |         |        |          | <p>infrastructure so they actually execute and prove the behavior. Memory automation behavior then becomes genuinely tested rather than merely scaffolded.</p> <p>Eleven work items marked finished still appear in the open-issues document and are missing from the resolved-items document, so the two views disagree about their state and become untrustworthy. The workflow regenerates the tracker document from the authoritative database so that finished items appear only in the resolved view. The human-readable trackers then accurately reflect the true state.</p> <p>The central model-verifier service reports each model's id as a numeric value, while HelixCode expects it as text — a type mismatch that could break how verified models are matched and displayed. The work aligns the two so the id is consistent text end to end. Correct model id keeps verification, listing, and state accurate for users.</p> <p>HelixCode is now wired to read advanced capability indicators (protocols, code intelligence, retrieval skills, plugins) from the central verifier, but the verifier's live responses do not yet include those fields, so the flags always read as unsupported. The work is to have the verifier publish these capability values it already computes. Then users see accurate per-model capability information across the product.</p> <p>Several mandated automated test categories — load/denial-of-service</p> |

|         |      |                    |          | <p>scaling, stress and chaos, and user interface/experience — were not exercised in the latest real-infrastructure run, so their current health is unconfirmed. The work is to run each of these test types against real infrastructure and capture proof of the results. This completes the promised full test-type coverage and confirms the product holds up under load and adverse conditions.</p> <p>The project depends on many other code modules, and a full health check of all of them (does each build, pass static checks, and pass its tests) could not finish in the latest session. The work is to run that complete health sweep and record the result for each module. This assures that the whole codebase, not just the main application, is in good shape.</p> <p>The end-to-end challenge runner can now launch all its scenarios (a minor option was just fixed), but the scenarios still need to be executed against a live server with a real user to confirm the complete user journey works. The work is to stand up a server and run the challenges, capturing the results. This provides real proof of the headline user workflows functioning end to end.</p> |
